

Startup Engineering

AngularJS 101 and Firebase

Sung Kim

So far

- AWS (EC2)
- Basic Linux Command
- HTML/CSS/Bootstrap
- Git/github
- AngularJS
- Android

Project Mission

Full stack

Project todo

- Proposal presentation on Jan 25, 3PM
 - Why we should use your web/mobile app?
 - Key requirements (features) + wireframe?
- Select and form your own team (3~4 people)
- Find something your team is interested in
- Use trello & github issue trackers from the beginning (brainstorming).

AngularJS Demo

AngularJS

O'REILLY®

Brad Green & Shyam Seshadri

AngularJS Features

1. Client template
2. Date binding
3. Dependency Injection
4. Directives

I. Client-side template

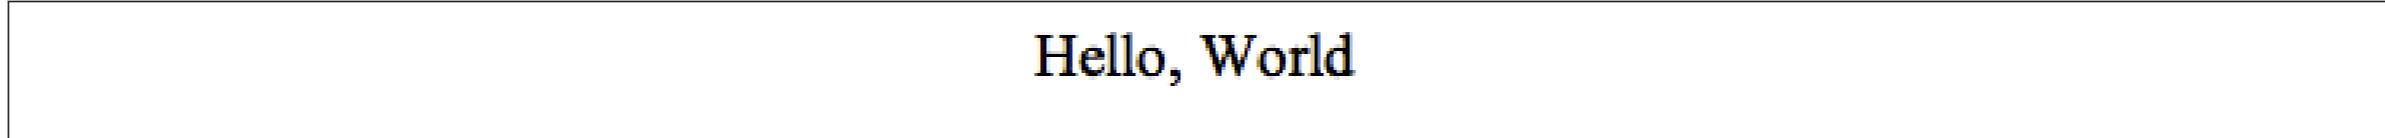

For it, we'll create our template in *hello.html*:

```
<html ng-app>
<head>
  <script src="angular.js"></script>
  <script src="controllers.js"></script>
</head>
<body>
  <div ng-controller='HelloController'>
    <p>{{greeting.text}}, World</p>
  </div>
</body>
</html>
```

And our logic in *controllers.js*:

```
function HelloController($scope) {
  $scope.greeting = { text: 'Hello' };
}
```

Loading *hello.html* into any browser will then produce what we see in Figure 1-1:

Hello, World

Scope in AngularJS

View, Controllers & Scope

\$scope is the "glue" (ViewModel) between a controller and a view

I. Client-side template

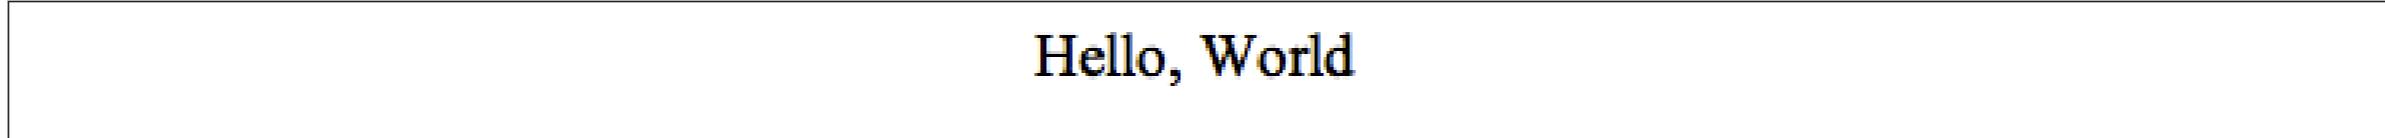

For it, we'll create our template in *hello.html*:

```
<html ng-app>
<head>
  <script src="angular.js"></script>
  <script src="controllers.js"></script>
</head>
<body>
  <div ng-controller='HelloController'>
    <p>{{greeting.text}}, World</p>
  </div>
</body>
</html>
```

And our logic in *controllers.js*:

```
function HelloController($scope) {
  $scope.greeting = { text: 'Hello' };
}
```

Loading *hello.html* into any browser will then produce what we see in Figure 1-1:

Hello, World

2. Data binding

Here's the new template:

```
<html ng-app>
<head>
  <script src="angular.js"></script>
  <script src="controllers.js"></script>
</head>
<body>
  <div ng-controller='HelloController'>
    <input ng-model='greeting.text'>
    <p>{{greeting.text}}, World</p>
  </div>
</body>
</html>
```

The controller, `HelloController`, can stay exactly the same.

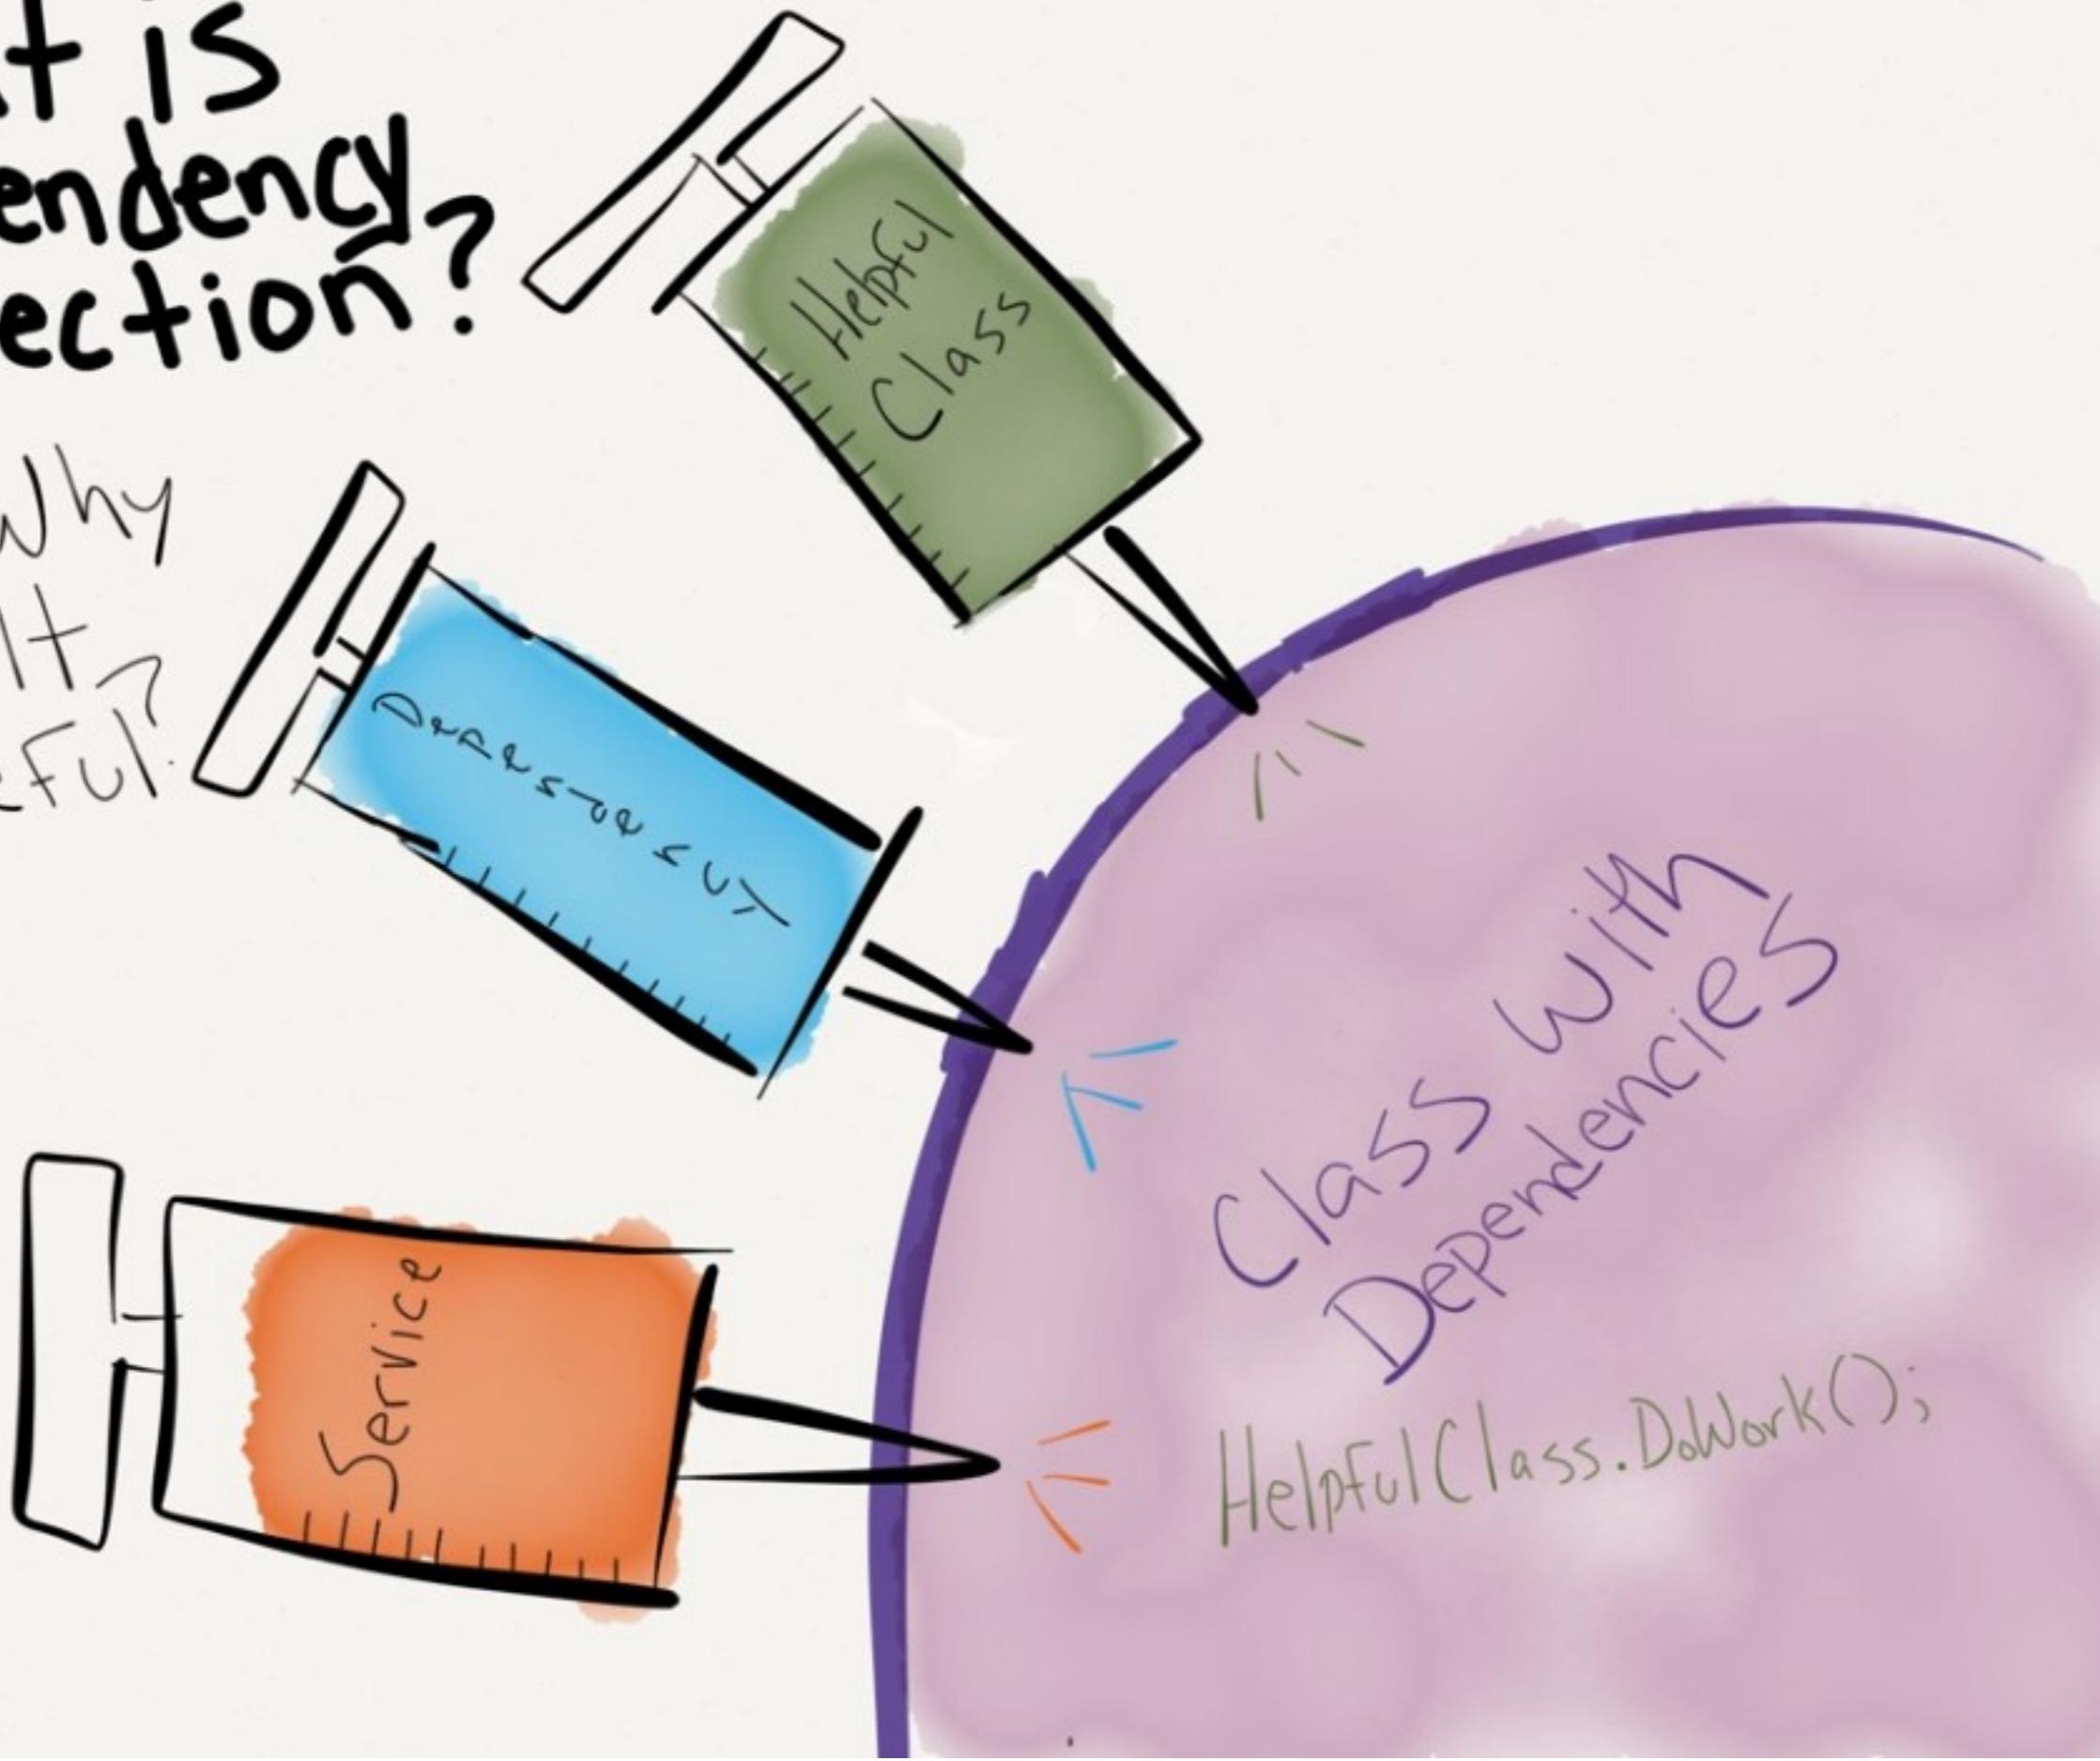

Loading it in a browser, we'd see the screen captured in [Figure 1-2](#).

Hello, World

What is Dependency Injection?

↳ Why
is it
useful?

3. Dependency Injection

“In software engineering, dependency injection is a software design pattern that implements inversion of control for resolving dependencies. A dependency is an object that can be used (a service). An injection is the passing of a dependency to a dependent object (a client) that would use it.” Wikipedia, the free encyclopedia

841 Basically, instead of having your objects creating a dependency or asking a factory object to make one for them, you pass the needed dependencies in to the constructor or via property setters, and you make it somebody else's problem (an object further up the dependency graph, or a dependency injector that builds the dependency graph). A dependency as I'm using it here is any other object the current object needs to hold a reference to.

✓ One of the major advantages of dependency injection is that it can make testing lots easier. Suppose you have an object which in its constructor does something like:

```
public SomeClass() {  
    myObject = Factory.getObject();  
}
```

This can be troublesome when all you want to do is run some unit tests on SomeClass, especially if myObject is something that does complex disk or network access. So now you're looking at mocking myObject but also somehow intercepting the factory call. Hard. Instead, pass the object in as an argument to the constructor. Now you've moved the problem elsewhere, but testing can become lots easier. Just make a dummy myObject and pass that in. The constructor would now look a bit like:

```
public SomeClass (MyClass myObject) {  
    this.myObject = myObject;  
}
```

Dependency Injection

Most people can probably work out the other problems that might arise when not using dependency injection while testing (like classes that do too much work in their constructors etc.) Most of this is stuff I picked up on the [Google Testing Blog](#), to be perfectly honest...

Dependency Injection in AngularJS

```
function HelloController($scope, $location) {  
  $scope.greeting = { text: 'Hello' };  
  // use $location for something good here...  
}
```

Directives

- ng-app
- ng-controller
- ng-repeat
- ng-click
- ng-model
- ng-show

Example

```
<html ng-app='myApp'>
<head>
  <title>Your Shopping Cart</title>
</head>
<body ng-controller='CartController'>
  <h1>Your Order</h1>
  <div ng-repeat='item in items'>
    <span>{{item.title}}</span>
    <input ng-model='item.quantity'>
    <span>{{item.price | currency}}</span>
    <span>{{item.price * item.quantity | currency}}</span>
    <button ng-click="remove($index)">Remove</button>
  </div>
  <script src="angular.js"></script>
  <script>
    function CartController($scope) {
      $scope.items = [
        {title: 'Paint pots', quantity: 8, price: 3.95},
        {title: 'Polka dots', quantity: 17, price: 12.95},
        {title: 'Pebbles', quantity: 5, price: 6.95}
      ];
      $scope.remove = function(index) {
        $scope.items.splice(index, 1);
      }
    }
  </script>
</body>
</html>
```

Your Shopping Cart				
Pebbles	8	\$3.95	\$31.60	<input type="button" value="Remove"/>
Paint pots	17	\$12.95	\$220.15	<input type="button" value="Remove"/>
Prunes	5	\$6.95	\$34.75	<input type="button" value="Remove"/>

Anatomy of AngularJS Apps

Invoking Angular

Any application must do two things to start Angular:

1. Load the *angular.js* library
2. Tell Angular which part of the DOM it should manage with the `ng-app` directive

Loading the Script

Loading the library is straightforward and follows the same rules as any other JavaScript library. You can load the script from Google's content delivery network (CDN), like so:

```
<script  
    src="https://ajax.googleapis.com/ajax/libs/angularjs/1.0.4/angular.min.js">  
</script>
```

Declaring Angular's Boundaries with ng-app

The `ng-app` directive lets you tell Angular which part of your page it should expect to manage. If you're building an all-Angular application, you should include `ng-app` as part of the `<html>` tag, like so:

```
<html ng-app>  
...  
</html>
```

This tells Angular to manage all DOM elements in the page.

If you've got an existing app where some other technology expects to manage the DOM, such as Java or Rails, you can tell Angular to manage only a part of the page by placing it on some element like a `<div>` within the page.

```
<html>  
...  
<div ng-app>  
...  
</div>  
...  
</html>
```

Model View Controller

- A model containing data that represents the current state of your application.
- Views that display this data.
- Controllers that manage the relationship between your model and your views.

```
var someText = 'You have started your journey.';
```

```
<p>{{someText}}</p>
```

The controllers are classes or types you write to tell Angular which objects or primitives make up your model by assigning them to the `$scope` object passed into your controller:

```
function TextController($scope) {  
  $scope.someText = someText;  
}
```

```
<html ng-app>
<body ng-controller="TextController">
  <p>{{someText}}</p>

  <script
    src="https://ajax.googleapis.com/ajax/libs/angularjs/1.0.1/angular.min.js">
</script>

<script>
  function TextController($scope) {
    $scope.someText = 'You have started your journey.';
  }
</script>
</body>
</html>
```

Module

```
<html ng-app='myApp'>
<body ng-controller='TextController'>
  <p>{{someText.message}}</p>

<script
  src="https://ajax.googleapis.com/ajax/libs/angularjs/1.0.1/angular.min.js">
</script>

<script>
  var myAppModule = angular.module('myApp', []);
  myAppModule.controller('TextController',
    function($scope) {
      var someText = {};
      someText.message = 'You have started your journey.';
      $scope.someText = someText;
    });
</script>
</body>
</html>
```

Data binding

```
<form ng-controller="SomeController">  
  <input type="checkbox" ng-model="youCheckedIt">  
</form>
```

This means that:

1. When the user checks the box, a property called `youCheckedIt` on the `SomeController`'s `$scope` will become true. Unchecking the box makes `youCheckedIt` false.
2. If you set `$scope.youCheckedIt` to true in `SomeController`, the box becomes checked in the UI. Setting it to false unchecks the box.

```
<html ng-app>
<head>
  <script src="angular.js"></script>
  <script src="controllers.js"></script>
</head>
<body>
  <div ng-controller='HelloController'>
    <input ng-model='greeting.text'>
    <p>{{greeting.text}}, World</p>
  </div>
</body>
</html>
```

The controller, `HelloController`, can stay exactly the same.

Loading it in a browser, we'd see the screen captured in [Figure 1-2](#).

Hello, World

ng-change

```
<form ng-controller="StartUpController">
  Starting: <input
    ng-model="funding.startingEstimate">
  Recommendation: {{funding.needed}}
</form>
```

```
function StartUpController($scope) {
  $scope.funding = { startingEstimate: 0 };

  $scope.computeNeeded = function() {
    $scope.needed = $scope.startingEstimate * 10;
  };
}
```

watch?

```
<form ng-controller="StartUpController">
  Starting: <input ng-change="computeNeeded()"
    ng-model="funding.startingEstimate">
  Recommendation: {{funding.needed}}
</form>
```

```
function StartUpController($scope) {
  $scope.funding = { startingEstimate: 0 };

  $scope.computeNeeded = function() {
    $scope.needed = $scope.startingEstimate * 10;
  };
}
```

watch?

```
<form ng-controller="StartUpController">
  Starting: <input ng-change="computeNeeded()"
    ng-model="funding.startingEstimate">
  Recommendation: {{funding.needed}}
</form>
```

```
function StartUpController($scope) {
  $scope.funding = { startingEstimate: 0 };

  computeNeeded = function() {
    $scope.funding.needed = $scope.funding.startingEstimate * 10;
  };

  $scope.$watch('funding.startingEstimate', computeNeeded);
}
```

ng-submit

```
<form ng-submit="requestFunding()" ng-controller="StartUpController">
  Starting: <input ng-change="computeNeeded()" ng-model="startingEstimate">
  Recommendation: {{needed}}
  <button>Fund my startup!</button>
</form>

function StartUpController($scope) {
  $scope.computeNeeded = function() {
    $scope.needed = $scope.startingEstimate * 10;
  };

  $scope.requestFunding = function() {
    window.alert("Sorry, please get more customers first.");
  };
}
```

ng-click

```
<div ng-click="doSomething()">...</div>
```

```
<form ng-submit="requestFunding()" ng-controller="StartUpController">
  Starting: <input ng-change="computeNeeded()" ng-model="startingEstimate">
  Recommendation: {{needed}}
  <button>Fund my startup!</button>
  <button ng-click="reset()">Reset</button>
</form>
```

```
function StartUpController($scope) {
  $scope.computeNeeded = function() {
    $scope.needed = $scope.startingEstimate * 10;
  };
}
```

```
$scope.requestFunding = function() {
  window.alert("Sorry, please get more customers first.");
};
```

List, Tables, and Other repeated Elements

```
var students = [{name:'Mary Contrary', id:'1'},  
                {name:'Jack Sprat', id:'2'},  
                {name:'Jill Hill', id:'3'}];
```

```
function StudentListController($scope) {  
  $scope.students = students;  
}
```

To display this list of students, we can do something like the following:

```
<ul ng-controller=''>  
  <li ng-repeat='student in students'>  
    <a href='/student/view/{{student.id}}'>{{student.name}}</a>  
  </li>  
</ul>
```

Automatic update (data-binding), of course!

```
var students = [{name:'Mary Contrary', id:'1'},  
                {name:'Jack Sprat', id:'2'},  
                {name:'Jill Hill', id:'3'}];  
  
function StudentListController($scope) {  
    $scope.students = students;  
  
    $scope.insertTom = function () {  
        $scope.students.splice(1, 0, {name:'Tom Thumb', id:'4'});  
    };  
}
```

and adding a button to invoke it in the template:

```
<ul ng-controller='''>  
  <li ng-repeat='student in students'>  
    <a href='/student/view/{{student.id}}'>{{student.name}}</a>  
  </li>  
</ul>  
<button ng-click="insertTom()">Insert</button>
```

we now see:

- Mary Contrary
- Tom Thumb
- Jack Sprat
- Jill Hill

ng-repeat comes with \$index

```
<table ng-controller='AlbumController'>
  <tr ng-repeat='track in album'>
    <td>{{$index + 1}}</td>
    <td>{{track.name}}</td>
    <td>{{track.duration}}</td>
  </tr>
</table>
```

Hiding and Showing ng-hide & ng-show

```
<div ng-controller='DeathrayMenuController'>
  <button ng-click='toggleMenu()'>Toggle Menu</button>
  <ul ng-show='menuState.show'>
    <li ng-click='stun()'>Stun</li>
    <li ng-click='disintegrate()'>Disintegrate</li>
    <li ng-click='erase()'>Erase from history</li>
  </ul>
</div>

function DeathrayMenuController($scope) {
  $scope.menuState.show = false;

  $scope.toggleMenu = function() {
    $scope.menuState.show = !$scope.menuState.show;
  };

  // death ray functions left as exercise to reader
}
```

CSS Classes and Styles

Given this CSS:

```
.menu-disabled-true {  
  color: gray;  
}
```

you could show the `stun` function of your DeathRay as disabled with this template:

```
<div ng-controller='DeathrayMenuController'>  
  <ul>  
    <li class='menu-disabled-{{isDisabled}}' ng-click='stun()'>Stun</li>  
    ...  
  </ul>  
<div/>
```

where you'd set the `isDisabled` property via your controller as appropriate:

```
function DeathrayMenuController($scope) {  
  $scope.isDisabled = false;  
  
  $scope.stun = function() {  
    // stun the target, then disable menu to allow regeneration  
    $scope.isDisabled = 'true';  
  };  
}
```

```
.error {
  background-color: red;
}

.warning {
  background-color: yellow;
}

<div ng-controller='HeaderController'>
  ...
  <div ng-class='{error: isError, warning: isWarning}'>{{messageText}}</div>
  ...
  <button ng-click='showError()'>Simulate Error</button>
  <button ng-click='showWarning()'>Simulate Warning</button>
</div>

function HeaderController($scope) {
  $scope.isError = false;
  $scope.isWarning = false;

  $scope.showError = function() {
    $scope.messageText = 'This is an error!';
    $scope.isError = true;
    $scope.isWarning = false;
  };

  $scope.showWarning = function() {
    $scope.messageText = 'Just a warning. Please carry on.';
    $scope.isWarning = true;
    $scope.isError = false;
  };
}
```

src and href attributes

When data binding to an `` or `<a>` tag, the obvious path of using `{{ }}` in the `src` or `href` attributes won't work well. Because browsers are aggressive about loading images parallel to other content, Angular doesn't get a chance to intercept data binding requests. While the obvious syntax for an `` might be:

```

```

Instead, you should use the `ng-src` attribute and write your template as:

```

```

Similarly, for the `<a>` tag, you should use `ng-href`:

```
<a ng-href="/shop/category={{numberOfBalloons}}">some text</a>
```

Expressions (but bring them in to JS)

simple math (+, -, /, *, %), make comparisons (==, !=, >, <, >=, <=), perform boolean logic (&&, ||, !) and bitwise operations (\^, &, |). You can call functions you expose on \$scope in your controller and you can reference arrays and object notation ([], { }, .).

All of these are valid examples of expressions:

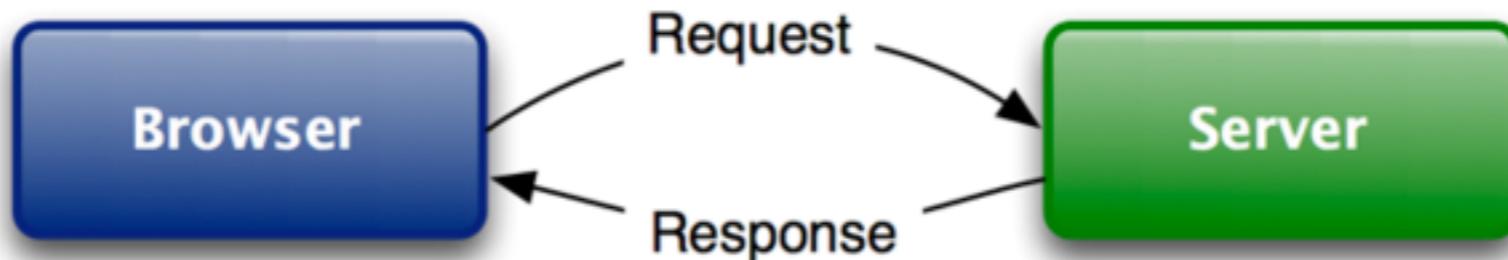

```
<div ng-controller='SomeController'>
  <div>{{recompute() / 10}}</div>
  <ul ng-repeat='thing in things'>
    <li ng-class='{highlight: $index % 4 >= threshold($index)}'>
      {{otherFunction($index)}}
    </li>
  </ul>
</div>
```

Talking to Servers

Okay, enough messing around. Real apps generally talk to real servers. Mobile apps and the emerging Chrome desktop apps may be exceptions, but for everything else, whether you want persistence in the cloud or real-time interactions with other users, you probably want your app to talk to a server.

For this, Angular provides a service called `$http`. It has an extensive list of abstractions that make it easier to talk to servers. It supports vanilla HTTP, JSONP, and CORS.

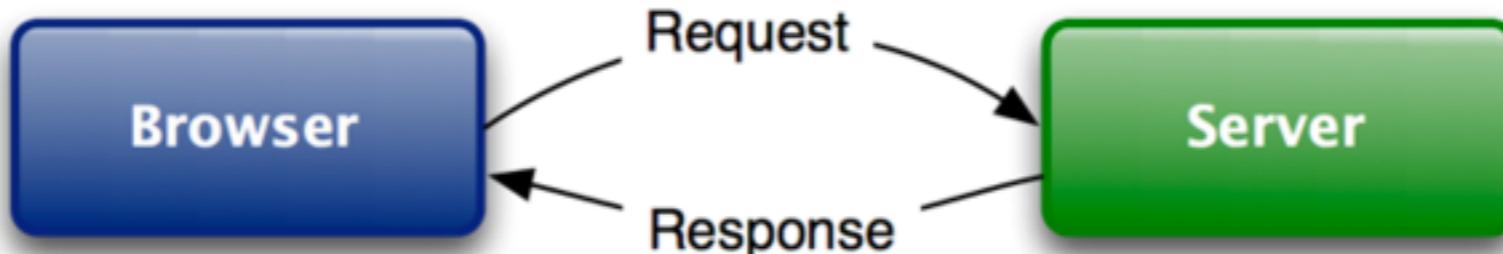

Understanding HTTP Basics

```
1 GET /home?pageId=c5789534 HTTP/1.1
2 Host: www.buildvsbreak.com
3 User-Agent: Mozilla/5.0
4 Accept: text/html,application/xhtml+xml,application/xml;
5 Accept-Language: en;q=0.5
6 Accept-Encoding: gzip, deflate
7 DNT: 1
8 Connection: keep-alive
```

```
1 HTTP/1.1 200 OK
2 Content-Type: text/html
3 Date: Mon 15 Jul 2013 20:48:49 GMT
4 Server: Apache/2.2.22 (Ubuntu)
5 X-Powered-By: PHP/5.3.10-1 ubuntu3.2
6 Content-Length: 2838
7
8 <!DOCTYPE html>
9 <html xmlns="http://www.w3.org/1999/xhtml">
10 <head>
11 <META http-equiv="Content-Type" content="text/html;
12 <title>Build vs Break Technical Training</title>
13 <meta name="keywords" content="Programming Security
14 <meta name="description" content="We provide training"
```

Understanding HTTP Basics

```
1 POST /signup HTTP/1.1
2 Host: www.buildvsbreak.com
3 User-Agent: Mozilla/5.0
4 Accept: */*
5 Accept-Language: en-US,en;q=0.5
6 Content-Type: application/x-www-form-urlencoded;
7 Referer: http://www.buildvsbreak.com/sign-up/
8 Content-Length: 114
9 Cookie: ubpv=a%2C73fa268a-e729-11e2-a9c8-12313e02a4f0;
10
11 name=Jon&email=jrose400%40gmail.com&company=test
```

```
1 HTTP/1.1 200 OK
2 Content-Type: text/html
3 Date: Mon 15 Jul 2013 20:48:49 GMT
4 Server: Apache/2.2.22 (Ubuntu)

```

AN SEO'S GUIDE TO HTTP STATUS CODES

Every web page you visit returns a status code, to give the browser additional information and instructions. Search bots see these codes, and some of them can impact SEO. Here are a few of the big ones:

CAST OF CHARACTERS

The
Visitor

The
Robot

Link
Juice

The
Pages

HTTP STATUS CODES

200

OK/Success Everyone arrives at Page A. There is much rejoicing!

301

Permanent* Everyone is redirected to the new location, Page B.

302

Temporary* Visitors and bots are redirected. Juice is left behind.

404

Not Found Original page is gone. Visitors may see a 404 page.

500

Server Error No page is returned. Everyone is lost and confused :(

503

Unavailable Asks everyone to come back later. A 404 alternative.

* Technically, code 301 is "Moved Permanently" and 302 is "Found", but SEOs refer to them as "Permanent Redirect" and "Temporary Redirect".

THE CANONICAL TAG

REL

Canonical

Alternative to 301-redirects. Visitors still see Page A.

Old school

```
var xmlhttp = new XMLHttpRequest();

xmlhttp.onreadystatechange = function() {
  if (xmlhttp.readyState == 4 && xmlhttp.status == 200) {
    var response = xmlhttp.responseText;
  } else if (xmlhttp.status == 400) { // or really anything in the 4 series
    // Handle error gracefully
  }
};

// Setup connection
xmlhttp.open("GET", "http://myserver/api", true);

// Make the request
xmlhttp.send();
```

Communicating over \$http

```
$http.get('api/user', {params: {id: '5'}}  
).success(function(data, status, headers, config) {  
  // Do something successful.  
}).error(function(data, status, headers, config) {  
  // Handle the error  
});
```

```
var postData = {text: 'long blob of text'};  
// The next line gets appended to the URL as params  
// so it would become a post request to /api/user?id=5  
var config = {params: {id: '5'}};  
$http.post('api/user', postData, config  
.success(function(data, status, headers, config) {  
  // Do something successful  
}).error(function(data, status, headers, config) {  
  // Handle the error  
});
```

More info?

A screenshot of a web browser showing the AngularJS homepage at https://angularjs.org. The page has a dark header with the AngularJS logo and navigation links for Home, Learn, Develop, and Discuss. A search bar is on the right. The URL in the address bar is https://angularjs.org. The top right corner shows browser-specific icons.

Modern API-Driven Application

Firebase

- Lightning-fast data synchronization
- No backend server
- Built-in authentication
- Free hosting
- Magical data bindings

REALTIME DATABASE

Store & sync data with our NoSQL cloud database. Data is stored as JSON, synced to all connected clients in realtime, and available when your app goes offline.

VERSION 1.1.2 – [CHANGELOG](#)

AngularFire

[Download v1.1.2](#)

[Contribute on GitHub](#)

Quickstart

5 min introduction

Guide

Step by Step Guide

API

Full List of API Methods

EXAMPLES

Code examples that showcase AngularFire.

- TodoMVC
- Tic-Tac-Tic-Tac-Toe
- Firereader
- Firepoker

RECIPES

Bite size code snippets that help speed up development.

- Date Object To A Firebase Timestamp
- Using \$Extend
- Filter A \$FirebaseArray

<https://www.firebaseio.com/docs/web/libraries/angular/>

1

Create an account

The first thing we need to do is [sign up for a free Firebase account](#). A brand new Firebase app will automatically be created with its own unique URL ending in `firebaseio.com`. We'll use this URL to authenticate users and store and sync data with [AngularFire](#).

Add Script Dependencies

In order to use AngularFire in a project, include the following script tags:

```
1. <!-- AngularJS -->
2. <script src="https://ajax.googleapis.com/ajax/libs/angularjs/1.3.15/angular.min.js"></script>
3.
4. <!-- Firebase -->
5. <script src="https://cdn.firebaseio.com/js/client/2.2.4.firebaseio.js"></script>
6.
7. <!-- AngularFire -->
8. <script src="https://cdn.firebaseio.com/libs/angularfire/1.1.3/angularfire.min.js"></script>
```

NPM, BOWER, AND YEOMAN SUPPORT

Firebase and AngularFire are available via npm and Bower as `firebase` and `angularfire`, respectively. A [Yeoman generator](#) is also available.

Add Three-Way, Object Bindings

Angular is known for its two-way data binding between JavaScript models and the DOM, and Firebase has a lightning-fast, realtime database. For synchronizing simple key / value pairs, AngularFire can be used to *glue* the two together, creating a "three-way data binding" which automatically synchronizes any changes to your DOM, your JavaScript, and the Firebase database.

To set up this three-way data binding, we use the `$firebaseObject` service introduced above to create a synchronized object, and then call `$bindTo()`, which binds it to a `$scope` variable.

```
APP.JS INDEX.HTML

1. var app = angular.module("sampleApp", ["firebase"]);
2.
3. app.controller("SampleCtrl", function($scope, $firebaseObject) {
4.   var ref = new Firebase("https://<YOUR-FIREBASE-APP>.firebaseio.com/data");
5.
6.   // download the data into a local object
7.   var syncObject = $firebaseObject(ref);
8.
9.   // synchronize the object with a three-way data binding
10.  // click on `index.html` above to see it used in the DOM!
11.  syncObject.$bindTo($scope, "data");
12. });

INDEX.HTML
```

Synchronize Collections as Arrays

Three-way data bindings are amazing for simple key / value data. However, there are many times when an array would be more practical, such as when managing a collection of messages. This is done using the `$firebaseArray` service.

We synchronize a list of messages into a **read-only** array by using the `$firebaseArray` service and then assigning the array to `$scope`:

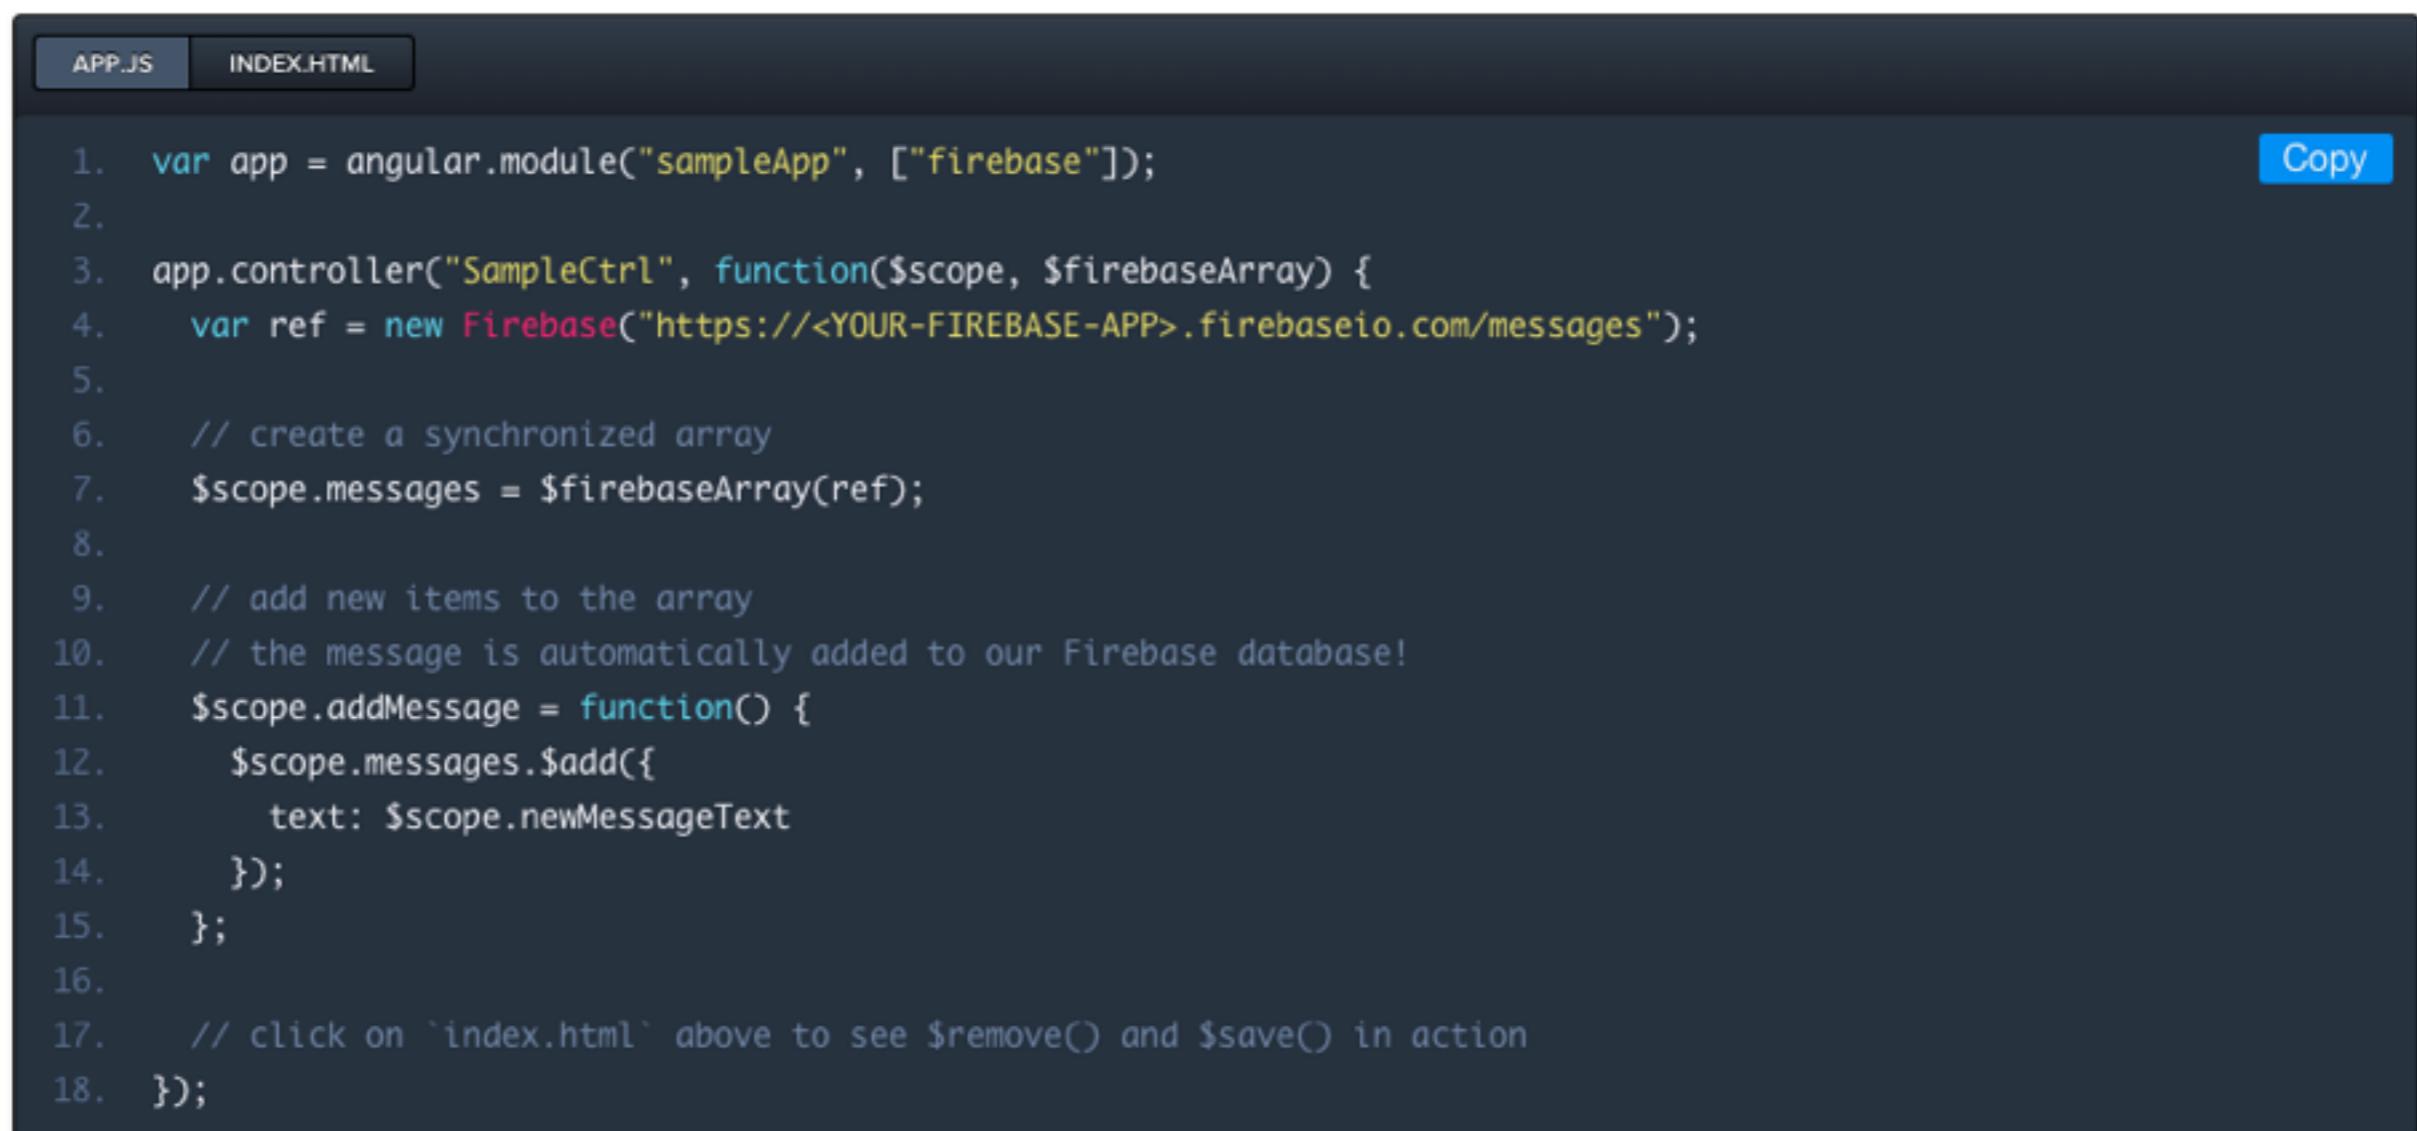

```
APP.JS INDEX.HTML Copy

1. var app = angular.module("sampleApp", ["firebase"]);
2.
3. app.controller("SampleCtrl", function($scope, $firebaseArray) {
4.   var ref = new Firebase("https://<YOUR-FIREBASE-APP>.firebaseio.com/messages");
5.
6.   // create a synchronized array
7.   // click on `index.html` above to see it used in the DOM!
8.   $scope.messages = $firebaseArray(ref);
9. });
```

Synchronize Collections as Arrays

Because the array is synchronized with server data and being modified concurrently by the client, it is possible to lose track of the fluid array indices and corrupt the data by manipulating the wrong records. Therefore, the placement of items in the list should never be modified directly by using array methods like `push()` or `splice()`.

Instead, AngularFire provides a set of methods compatible with manipulating synchronized arrays: `$add()`, `$save()`, and `$remove()`.

The screenshot shows a code editor interface with two tabs at the top: "APP.JS" and "INDEX.HTML". The "APP.JS" tab is active and contains the following code:

```
1. var app = angular.module("sampleApp", ["firebase"]);
2.
3. app.controller("SampleCtrl", function($scope, $firebaseArray) {
4.   var ref = new Firebase("https://<YOUR-FIREBASE-APP>.firebaseio.com/messages");
5.
6.   // create a synchronized array
7.   $scope.messages = $firebaseArray(ref);
8.
9.   // add new items to the array
10.  // the message is automatically added to our Firebase database!
11.  $scope.addMessage = function() {
12.    $scope.messages.$add({
13.      text: $scope.newMessageText
14.    });
15.  };
16.
17.  // click on `index.html` above to see $remove() and $save() in action
18.});
```

A blue "Copy" button is located in the top right corner of the code editor.

Add Authentication

Firebase provides [a hosted authentication service](#) which offers a completely client-side solution to account management and authentication. It supports anonymous authentication, email / password login, and login via several OAuth providers, including Facebook, GitHub, Google, and Twitter.

AngularFire provides a service named `$firebaseAuth` which wraps the authentication methods provided by the Firebase client library. It can be injected into any controller, service, or factory.

```
1. app.controller("SampleCtrl", function($scope, $firebaseAuth) {  
2.   var ref = new Firebase("https://<YOUR-FIREBASE-APP>.firebaseio.com");  
3.  
4.   // create an instance of the authentication service  
5.   var auth = $firebaseAuth(ref);  
6.  
7.   // login with Facebook  
8.   auth.$authWithOAuthPopup("facebook").then(function(authData) {  
9.     console.log("Logged in as:", authData.uid);  
10.    }).catch(function(error) {  
11.      console.log("Authentication failed:", error);  
12.    });  
13.  });
```

```
1 // define our app and dependencies (remember to include firebase!)
2 var app = angular.module("sampleApp", ["firebase"]);
3
4 // this factory returns a synchronized array of chat messages
5 app.factory("chatMessages", ["$firebaseArray",
6   function($firebaseArray) {
7     // create a reference to the database location where we will store our data
8     var randomRoomId = Math.round(Math.random() * 100000000);
9     var ref = new Firebase("https://docs-sandbox.firebaseio.com/af/intro/demo/" + randomRoomId);
10
11    // this uses AngularFire to create the synchronized array
12    return $firebaseArray(ref);
13  }
14]);
15
16 app.controller("ChatCtrl", ["$scope", "chatMessages",
17   // we pass our new chatMessages factory into the controller
18   function($scope, chatMessages) {
19     $scope.user = "Guest " + Math.round(Math.random() * 100);
20
21     // we add chatMessages array to the scope to be used in our ng-repeat
22     $scope.messages = chatMessages;
23
24     // a method to create new messages; called by ng-submit
25     $scope.addMessage = function() {
26       // calling $add on a synchronized array is like Array.push(),
27       // except that it saves the changes to our database!
28       $scope.messages.$add({
29         from: $scope.user,
30         content: $scope.message
31       });
32
33       // reset the message input
34       $scope.message = "";
35     };
36
37     // if the messages are empty, add something for fun!
38     $scope.messages.$loaded(function() {
39       if ($scope.messages.length === 0) {
40         $scope.messages.$add({
41           from: "Firebase Docs",
42           content: "Hello world!"
43         });
44       }
45     });
46   }
47 ]);
```

Facebook web app setting

Facebook Authentication

Web Guide

User Authentication

Facebook Authentication

Configuring Your Application

To get started with Facebook authentication, you need to first [create a new Facebook application](#). Click the Add a New App button in the top right of that page and select Website as your platform. Then choose an App ID and click Create New Facebook App ID. Select your app's category and click Create App ID. In the top right, click Skip Quick Start.

In your Facebook app configuration, click on the **Settings** tab on the left-hand navigation menu. Then go to the **Advanced** tab at the top and scroll down to the **Security** section. At the bottom of that section, add `https://auth.firebaseio.com/v2/<YOUR-FIREBASE-APP>/auth/facebook/callback` to your **Valid OAuth redirect URIs** and click **Save Changes** at the bottom of the page.

Next, you'll need to get your app credentials from Facebook. Click on the **Basic** tab at the top of the page. You should still be within the **Settings** tab. Towards the top of this page, you will see your **App ID** and **App Secret**. Your **App ID** will be displayed in plain text and you can view your **App Secret** by clicking on the **Show** button and typing in your Facebook password. Copy these Facebook application credentials (**App ID** and **Secret**) in the **Login & Auth** section in your App Dashboard.

Facebook App Secret:

Configuring Your Facebook App

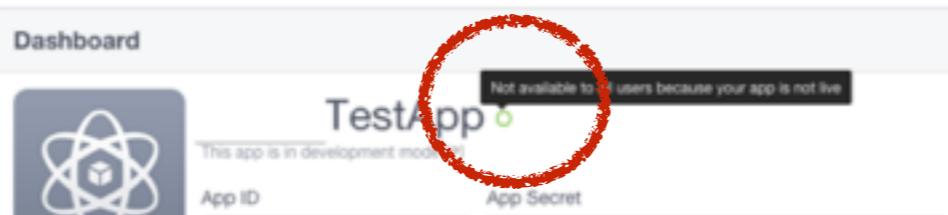

To get started with Facebook authentication, you need to first create a new Facebook application.

[Learn more](#)

1. Go to <https://developers.facebook.com/>

2. Click on the Apps menu on the top bar.

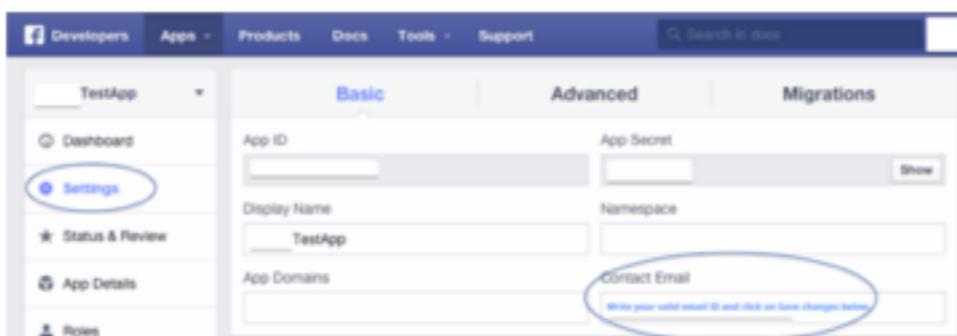

3. Select the respective app from the drop down.

The circle next to your app name is not fully green. When you hover mouse on it, you'll see a popup saying, "Not available to all users because your app is not live."

So next, you've to make it publicly available.

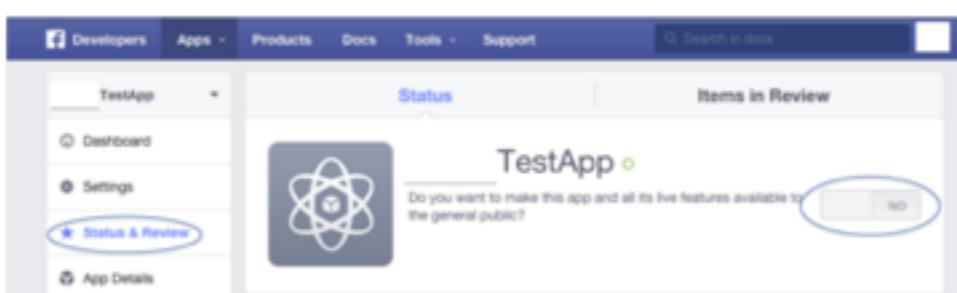

4. Click on setting at left panel. [see the screenshot below]

5. In Basic tab add your "Contact Email" (a valid email address - I've added the one which I'm using with developers.facebook.com) and make "Save changes".

6. Next click "Status & Review" at left panel. [see the screenshot below]

7. Look for this, Do you want to make this app and all its live features available to the general public? and Turn ON the switch next to this.

8. That's it! - App is now publicly available. See the fully green circle next to the app name.

Dashboard

TestApp

This app is public and available to all users

Securing Your Data

Firebase provides a flexible, expression-based rules language with JavaScript-like syntax to easily define how your data should be structured and when your data can be read from and written to. Combined with our login service which allows for easy authentication, you can define who has access to what data and keep all of your user's personal information secure. The rules live on the Firebase servers and are automatically enforced at all times.

FIREBASE RULES

```
1  {
2      "rules": {
3          ".read": true,
4          ".write": true
5      }
6 }
```

FIREBASE RULES

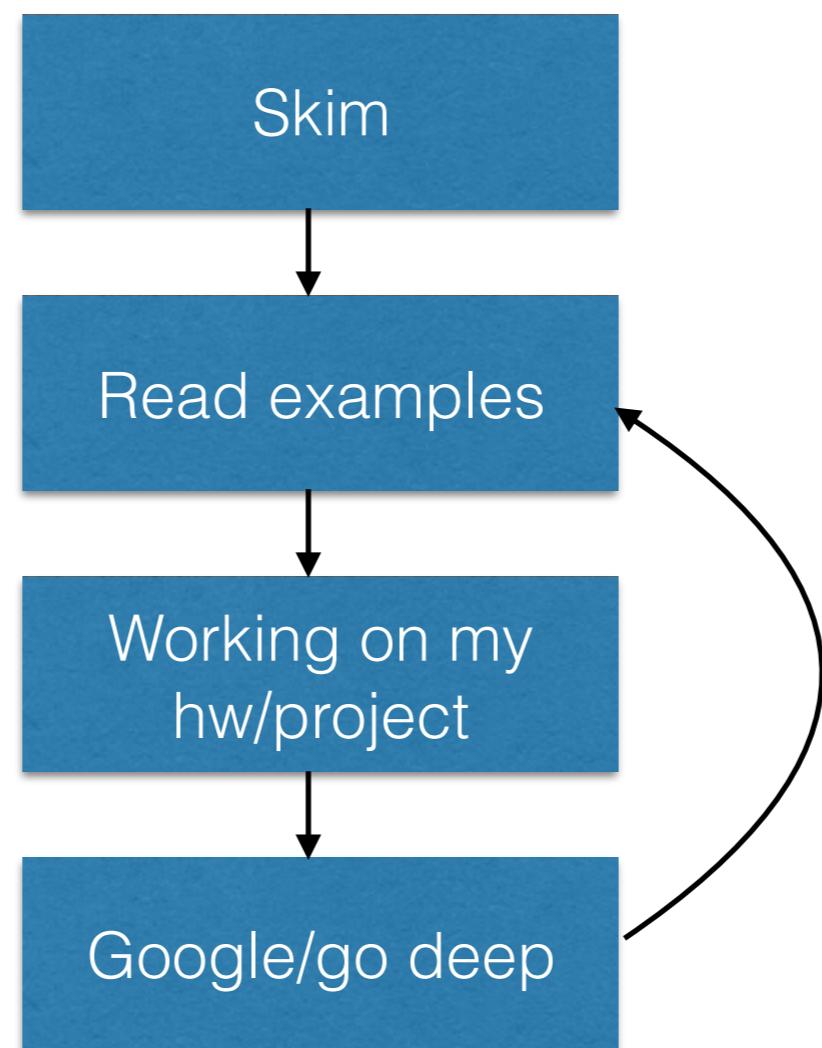

```
1  {
2    "rules": {
3      "@demo_": {
4        ".read": true,
5        ".write": "auth !== null && auth.uid === 'hunkim'"
6        // ".write": true
7      },
8
9      "$uid": {
10        // grants write access to the owner of this user account
11        // whose uid must exactly match the key ($uid)
12        ".write": "auth !== null && auth.uid === $uid",
13        ".read": "auth !== null && auth.uid === $uid"
14      }
15    }
16 }
```

FIREBASE RULES

```
1  {
2      "rules": {
3          ".read": false,
4          ".write": false,
5          "sales": {
6              "$fid": {
7                  ".write": false,
8                  // grants write access to the owner of this user account
9                  // whose uid must exactly match the key ($uid)
10                 ".read": "auth !== null && auth.uid === $fid"
11             }
12         },
13
14         "posts": {
15             "$fid": {
16                 // grants write access to the owner of this user account
17                 // whose uid must exactly match the key ($uid)
18                 ".write": "auth !== null && auth.uid === $fid",
19                 ".read": "auth !== null && auth.uid === $fid"
20             }
21         }
22     }
23 }
```

More bookmark demo

Steps of learning new stuff

Lab

- Do 5 min AngularFire tutorial: <https://www.firebaseio.com/tutorial/#tutorial/angular/0>
- Fork <https://github.com/hunkim/bookmark101>
- Design bookmark html
- Try basic app.js (basic bookmark features + FB login)
- Validate URL (<http://esmash.xyz> VS aa:test//url)
- make/work on your directory in gitworkspace and send a pull request

HW

- Individual Bookmark: each FB user should see only their bookmark.
- Get Title of the URL automatically.
- Get homepage thumbnail for each URL
- Post it s3 or EC2 with a nice (free)domain name
- Create an issue with your URL at <https://github.com/hunkim/bookmark101>

Hello Jindae Kim! You have 2 Bookmarks.

Why Angular?

If you're using JavaScript to create a dynamic website,
Angular is a good choice.

- Angular helps you organize your JavaScript
- Angular helps create responsive (as in fast) websites.
- Angular plays well with jQuery
- Angular is easy to test

SHAPING UP
WITH
ANGULAR.JS

Traditional Page-Refresh

The screenshot shows a web browser window displaying the Code School homepage at <https://www.codeschool.com/courses>. The page features a large, central call-to-action message: "Make your way down a **Path** and build specific skills, or wander through [All Courses.](#)". Below this, there are two main course sections: "Paths" and "All Courses".

Paths:

- Ruby**: Master your Ruby skills and increase your Rails street cred by learning to build dynamic, sustainable applications for the web. Topics covered: RUBY BASICS, RUBY ONLY, RUBY ON RAILS, STARTING RAILS, ADVANCED RUBY, TESTING.
- JavaScript**: Spend some time with this powerful scripting language and learn to build lightweight applications with enhanced user interfaces. Topics covered: JAVASCRIPT, JQUERY, BACKBONE.JS, NODE.JS, COFFEESCRIPT, EMBER.JS.

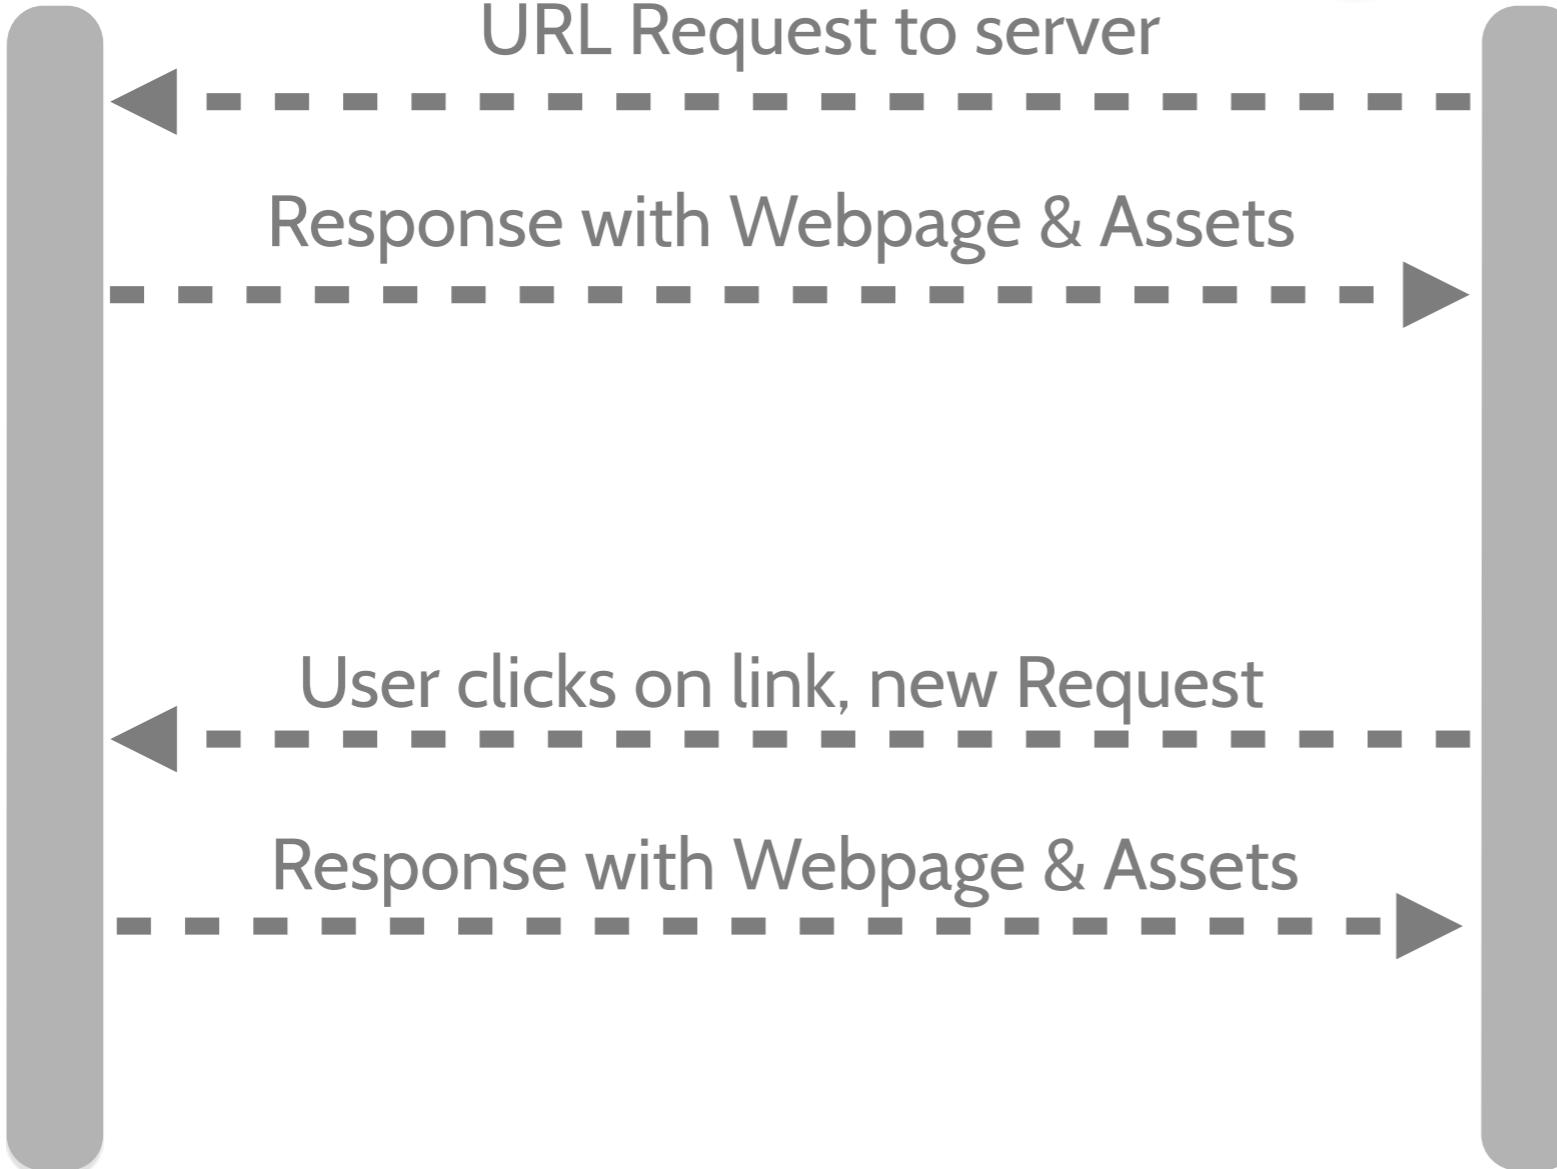

All Courses:

Navigation links at the top include COURSES (which is highlighted), SCREENCASTS, DISCUSS, SUPPORT, MY ACCOUNT, and SIGN OUT. The browser's address bar shows the URL <https://www.codeschool.com/courses>.

Modern API-Driven Application

What is Angular JS?

A client-side JavaScript Framework for adding interactivity to HTML.

How do we tell our HTML when to trigger our JavaScript?

```
<!DOCTYPE html>
<html>
  <body>
    . . .
  </body>
</html>
```

index.html

```
function Store(){
  alert('Welcome, Gregg!');
}
```

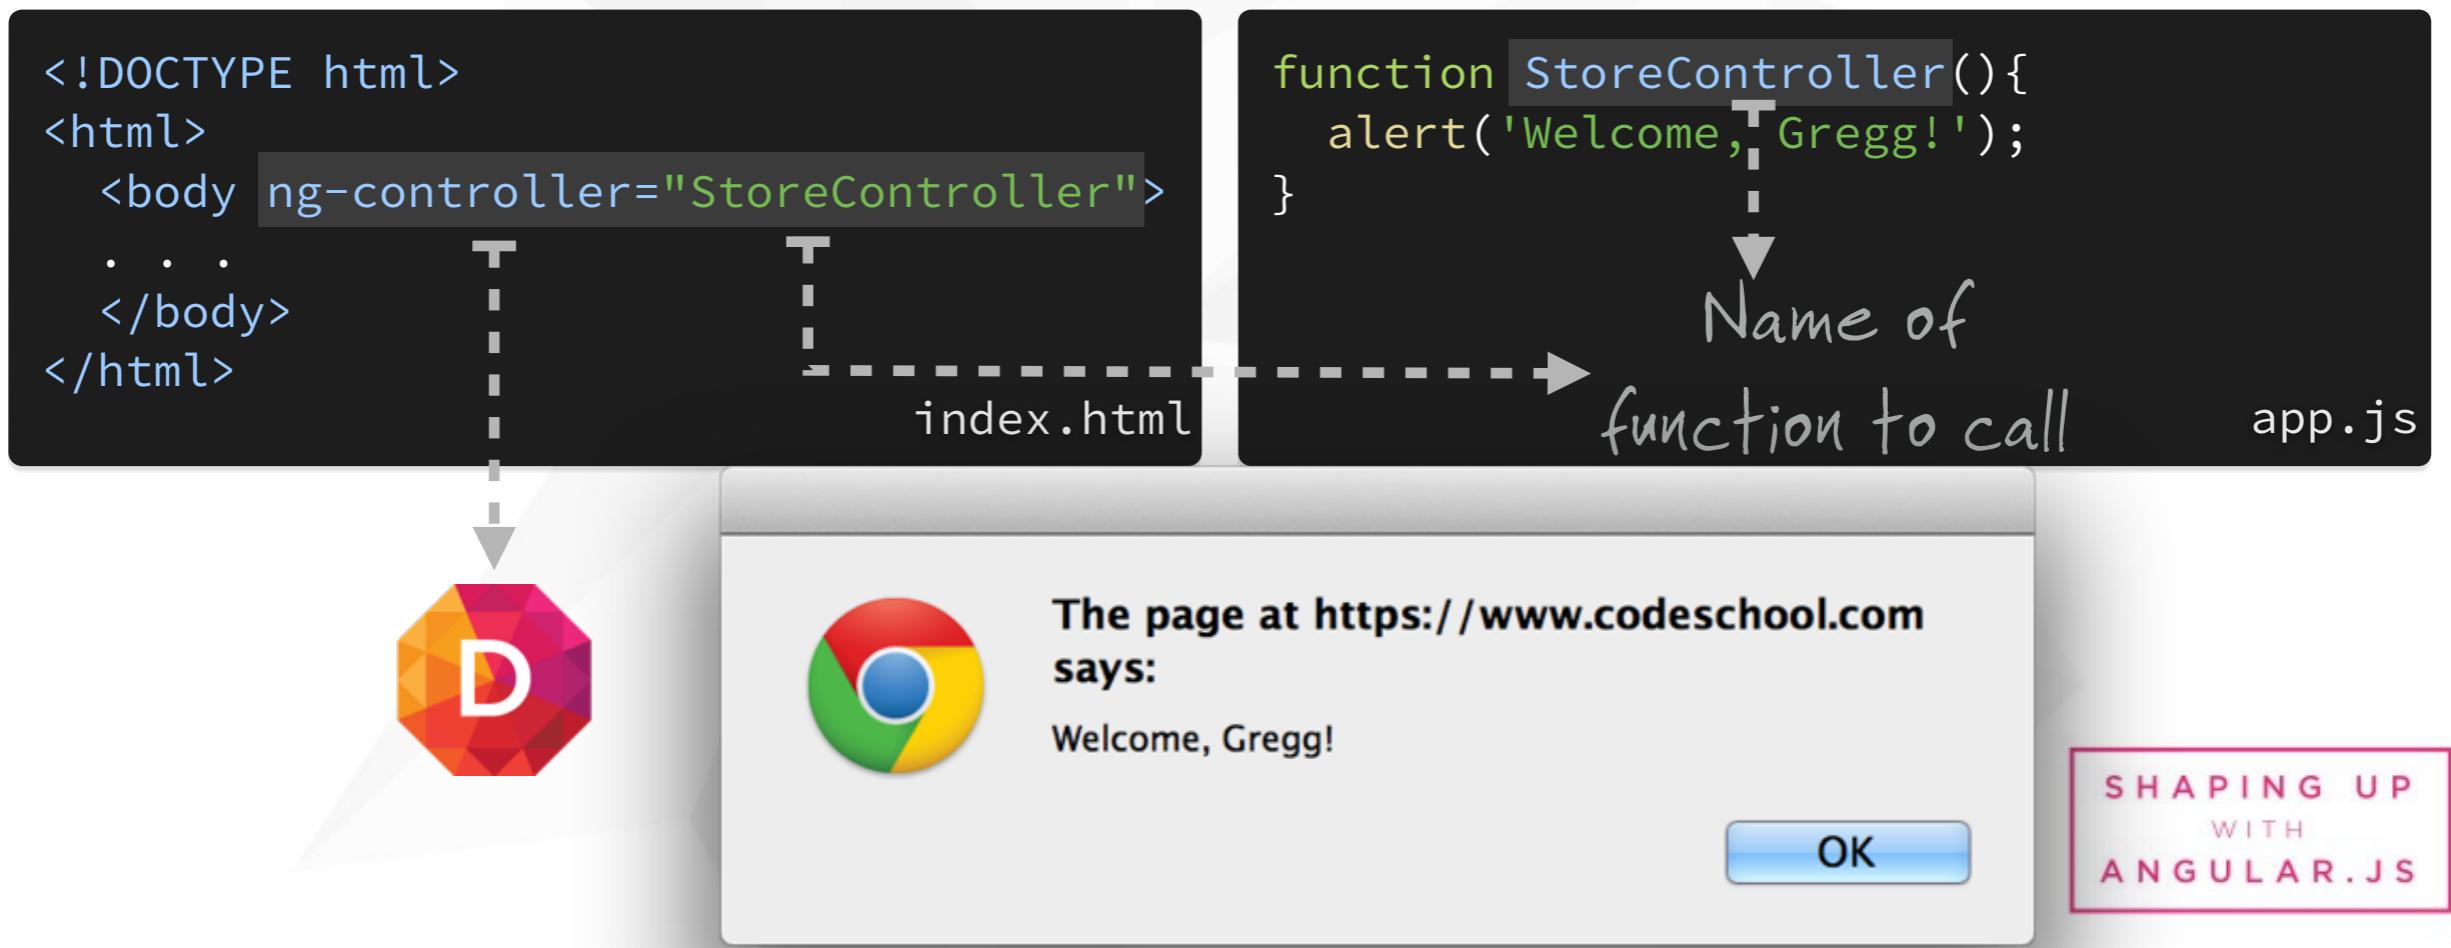

app.js

SHAPING UP
WITH
ANGULAR.JS

Directives

A Directive is a marker on a HTML tag that tells Angular to run or reference some JavaScript code.

Downloading the libraries

Download AngularJS <http://angularjs.org/>

We'll need angular.min.js

Download Twitter Bootstrap <http://getbootstrap.com/>

We'll need bootstrap.min.css

Getting Started

```
<!DOCTYPE html>
<html>
  <head>
    <link rel="stylesheet" type="text/css" href="bootstrap.min.css" />
  </head>
  <body>
    <script type="text/javascript" src="angular.min.js"></script>
  </body>
</html>
```

Twitter Bootstrap

AngularJS

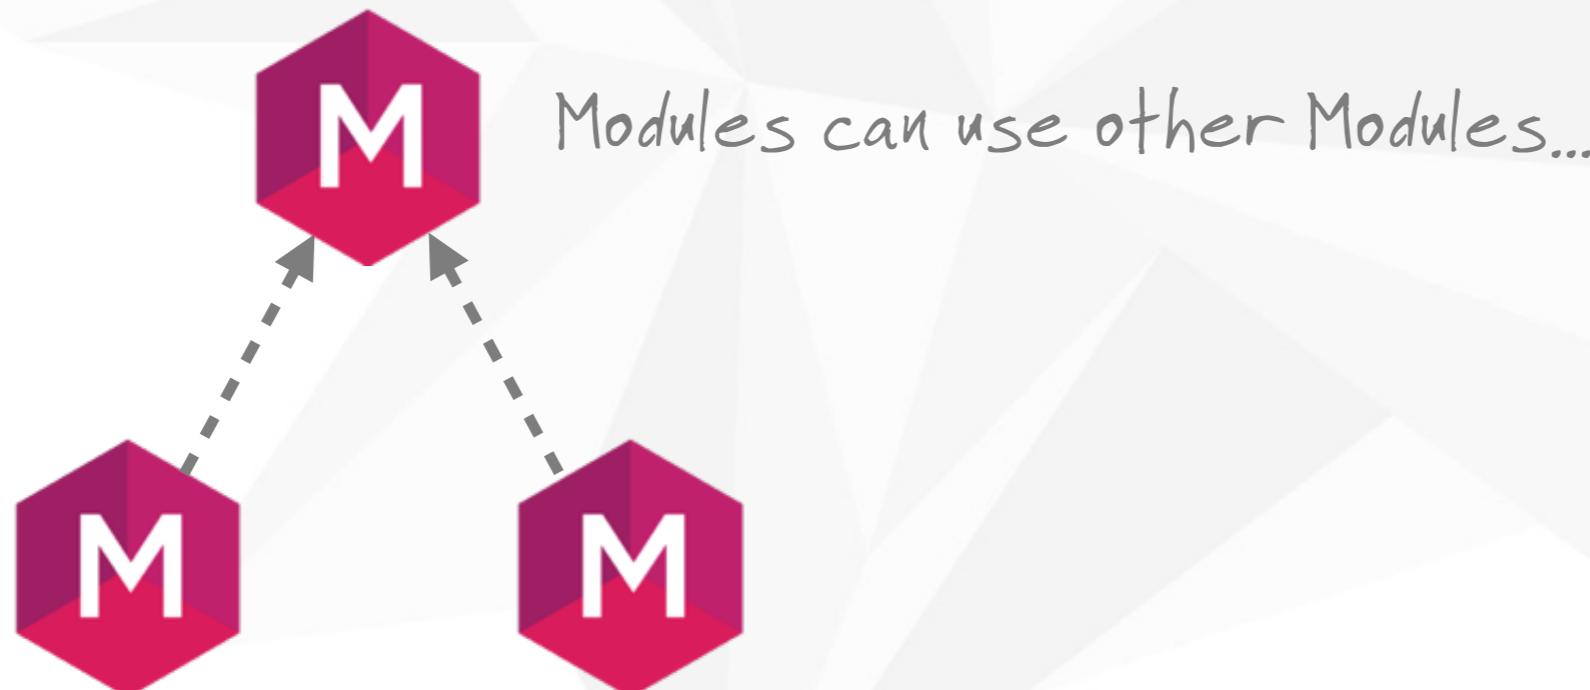

index.html

SHAPING UP
WITH
ANGULAR.JS

Modules

- Where we write pieces of our Angular application.
- Makes our code more maintainable, testable, and readable.
- Where we define dependencies for our app.

SHAPING UP
WITH
ANGULAR.JS

Creating Our First Module

```
var app = angular.module('store', [ ]);
```

AngularJS

Application
Name

Dependencies

*Other libraries we might need.
We have none... for now...*

SHAPING UP
WITH
ANGULAR.JS

Including Our Module

```
<!DOCTYPE html>
<html>
  <head>
    <link rel="stylesheet" type="text/css" href="bootstrap.min.css" />
  </head>
  <body>
    <script type="text/javascript" src="angular.min.js"></script>
    <script type="text/javascript" src="app.js"></script>
  </body>
</html>
```

index.html

```
var app = angular.module('store', [ ]);
```

app.js

SHAPING UP
WITH
ANGULAR.JS

Including Our Module

```
<!DOCTYPE html>
<html ng-app="store"> ←----- Run this module
  <head> when the document
    <link rel="stylesheet" type="text/css" href="bootstrap.min.css" />
  </head> loads.
  <body>
    <script type="text/javascript" src="angular.min.js"></script>
    <script type="text/javascript" src="app.js"></script>
  </body>
</html>
```

app.js

```
var app = angular.module('store', [ ]);
```

SHAPING UP
WITH
ANGULAR.JS

Expressions

Allow you to insert dynamic values into your HTML.

Numerical Operations

E

```
<p>
  I am {{4 + 6}}
</p>
```

evaluates to

```
<p>
  I am 10
</p>
```

String Operations

E

```
<p>
  {{"hello" + " you"}}
</p>
```

evaluates to

```
<p>
  hello you
</p>
```

+ More Operations:

<http://docs.angularjs.org/guide/expression>

SHAPING UP
WITH
ANGULAR.JS

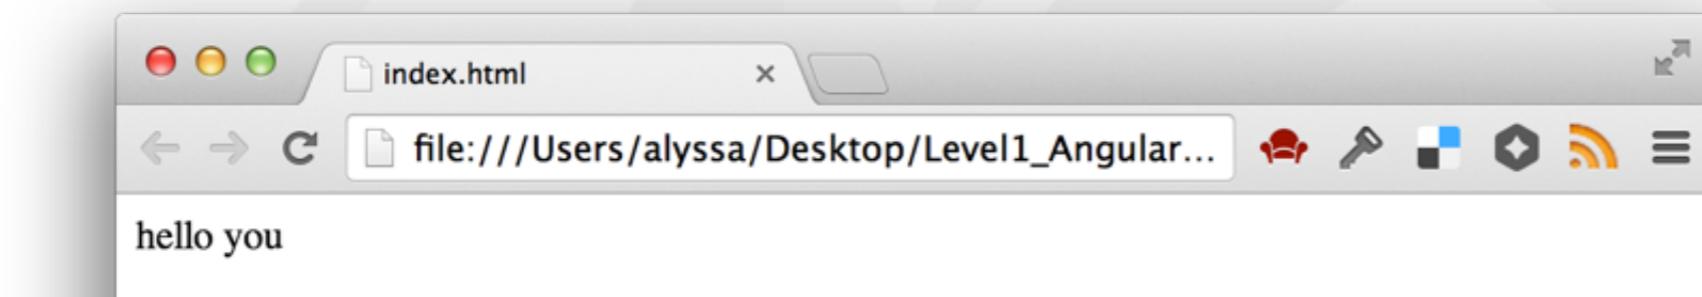

Including Our Module

```
<!DOCTYPE html>
<html ng-app="store">
  <head>
    <link rel="stylesheet" type="text/css" href="bootstrap.min.css" />
  </head>
  <body>
    <script type="text/javascript" src="angular.min.js"></script>
    <script type="text/javascript" src="app.js"></script>
    <p>{{"hello" + " you"}}</p>
  </body>
</html>
```

index.html

```
var app = angular.module('store', [ ]);
```

app.js

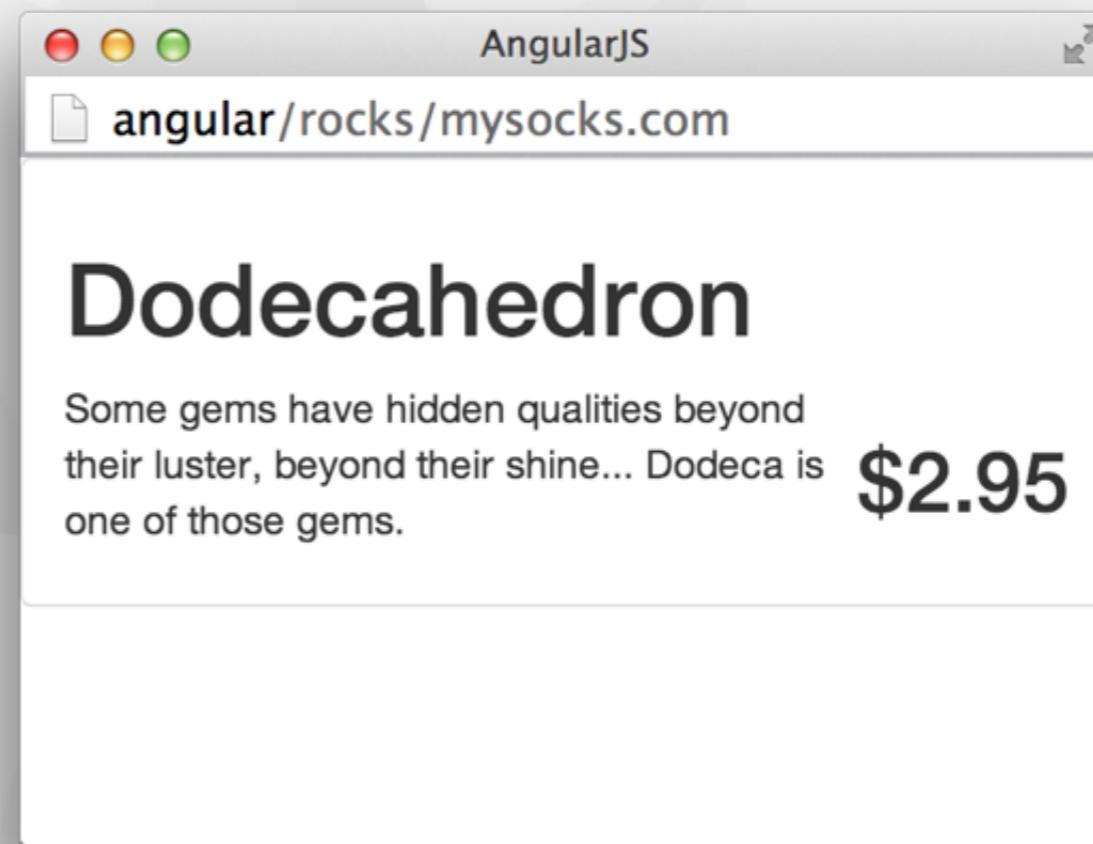

SHAPING UP
WITH
ANGULAR.JS

Working With Data

```
var gem = {  
  name: 'Dodecahedron',  
  price: 2.95,  
  description: '...',  
}
```

...just a simple
object we want to
print to the page.

SHAPING UP
WITH
ANGULAR.JS

Controllers

Controllers are where we define our app's behavior by defining functions and values.

*Wrapping your Javascript
in a closure is a good habit!*

```
(function(){
  var app = angular.module('store', [ ]);

  app.controller('StoreController', function(){
    });
})();
```

app.js

```
var gem = {
  name: 'Dodecahedron',
  price: 2.95,
  description: '... . . .',
}
```

Notice that controller is attached to (inside) our app.

SHAPING UP
WITH
ANGULAR.JS

Storing Data Inside the Controller

```
(function(){
  var app = angular.module('store', [ ]);

  app.controller('StoreController', function(){
    this.product = gem;
  });

  var gem = {
    name: 'Dodecahedron',
    price: 2.95,
    description: '...',
  }
})();
```

app.js

Now how do we
print out this
data inside our
webpage?

SHAPING UP
WITH
ANGULAR.JS

Our Current HTML

```
<!DOCTYPE html>
<html ng-app="store">
  <head>
    <link rel="stylesheet" type="text/css" href="bootstrap.min.css" />
  </head>
  <body>
    <div>
      <h1> Product Name </h1>
      <h2> $Product Price </h2>
      <p> Product Description </p>
    </div>
    <script type="text/javascript" src="angular.min.js"></script>
    <script type="text/javascript" src="app.js"></script>
  </body>
</html>
```

Let's load our data into
this part of the page.

index.html

Attaching the Controller

```
<body>
  <div>
    <h1> Product Name </h1>
    <h2> $Product Price </h2>
    <p> Product Description </p>
  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
(function(){
  var app = angular.module('store', [ ]);

  app.controller('StoreController', function(){
    this.product = gem;
  });
  .
  .
})();
```

app.js

SHAPING UP
WITH
ANGULAR.JS

Attaching the Controller

```
<body>
  <div Directive ng-controller="StoreController as store">
    <h1> Product Name </h1>
    <h2> $Product Price </h2>
    <p> Product Description </p>
  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
(function(){
  var app = angular.module('store', [ ]);

  app.controller('StoreController', function(){
    this.product = gem;
  });
  .
  .
})();
```

app.js

SHAPING UP
WITH
ANGULAR.JS

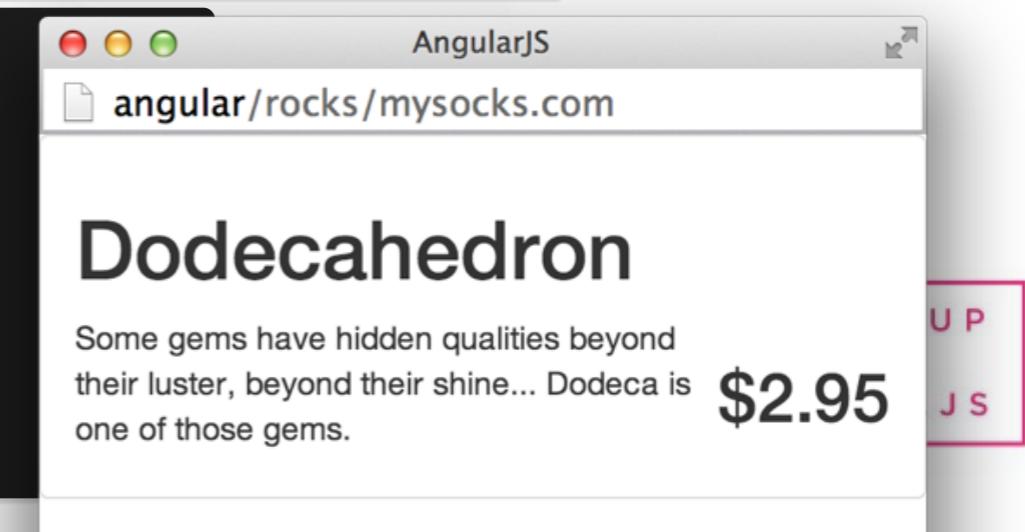

Displaying Our First Product

```
<body>
  <div ng-controller="StoreController as store">
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>
  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
(function(){
  var app = angular.module('store', [ ]);

  app.controller('StoreController', function(){
    this.product = gem;
  });
  ...
})();
```

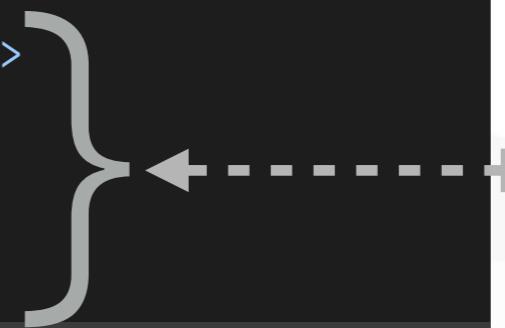

Understanding Scope

```
<body>
  <div ng-controller="StoreController as store">
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>
  </div>
  {{store.product.name}}
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

Would never print a value!

The scope of the Controller is only inside here...

Adding A Button

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>

  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
var gem = {
  name: 'Dodecahedron',
  price: 2.95,
  description: '...',
}
```

SHAPING UP
WITH
ANGULAR.JS

Adding A Button

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>
    <button> Add to Cart </button> ←----- Directives to
  </div>          the rescue!
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
var gem = {
  name: 'Dodecahedron',
  price: 2.95,
  description: '... .',
  canPurchase: false ←---...when this is true?
}
```

How can we
only show
this button...

SHAPING UP
WITH
ANGULAR.JS

NgShow Directive

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>
    <button ng-show="store.product.canPurchase"> Add to Cart </button>
  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
var gem = {
  name: 'Dodecahedron',
  price: 2.95,
  description: '...',
  canPurchase: false
}
```

Will only show the element if the value of the Expression is true.

SHAPING UP
WITH
ANGULAR.JS

```
10  <script data-require="angular.js@1.2.x" src="http://code.angularjs.org/1.2.15/angular.js">
11  <script src="app.js"></script>
12 </head>
13
14
15 <body ng-controller="StoreController as store">
16
17  <!-- Products Container -->
18 <div class="list-group">
19  <!-- Product Container -->
20 <div class="list-group-item">
21  <h1>{{store.product.name}}</h1>
22  <h2>${{store.product.price}}</h2>
23  <p>{{store.product.description}}</p>
24  <button ng-show="store.product.canPurchase">Add to Cart</button>
25 </div>
26 </div>
27 </body>
28
29 </html>
```

index.html

NgHide Directive

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>
    <button ng-show="store.product.canPurchase"> Add to Cart </button>
  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

index.html

```
var gem = {
  name: 'Dodecahedron',
  price: 2.95,
  description: '... .',
  canPurchase: true,
  soldOut: true
}
```

If the product is sold out
we want to hide it.

SHAPING UP
WITH
ANGULAR.JS

NgHide Directive

```
<body ng-controller="StoreController as store"> This is awkward and  
  <div ng-show="!store.product.soldOut"> a good example to  
    <h1> {{store.product.name}} </h1> use ng-hide!  
    <h2> ${{store.product.price}} </h2>  
    <p> {{store.product.description}} </p>  
    <button ng-show="store.product.canPurchase"> Add to Cart </button>  
  </div>  
  <script type="text/javascript" src="angular.min.js"></script>  
  <script type="text/javascript" src="app.js"></script>  
</body>
```

index.html

```
var gem = {  
  name: 'Dodecahedron',  
  price: 2.95,  
  description: '...',  
  canPurchase: true,  
  soldOut: true, ←-----}  
}
```

If the product is sold out
we want to hide it.

SHAPING UP
WITH
ANGULAR.JS

NgHide Directive

```
<body ng-controller="StoreController as store">
  <div ng-hide="store.product.soldOut">
    <h1> {{store.product.name}} </h1>
    <h2> ${{store.product.price}} </h2>
    <p> {{store.product.description}} </p>
    <button ng-show="store.product.canPurchase"> Add to Cart </button>
  </div>
  <script type="text/javascript" src="angular.min.js"></script>
  <script type="text/javascript" src="app.js"></script>
</body>
```

Much better!

index.html

```
var gem = {
  name: 'Dodecahedron',
  price: 2.95,
  description: '... .',
  canPurchase: true,
  soldOut: true, <----->
}
```

If the product is sold out
we want to hide it.

SHAPING UP
WITH
ANGULAR.JS

Multiple Products

```
app.controller('StoreController', function(){
  this.product = gem;
});

var gem = {
  name: "Dodecahedron",
  price: 2.95,
  description: "...",
  canPurchase: true,
}
      app.js
```

SHAPING UP
WITH
ANGULAR.JS

Multiple Products

```
app.controller('StoreController', function(){
  this.products = gems;
}); So we have multiple products...

var gems = [ <----- Now we have an array...
{
  name: "Dodecahedron",
  price: 2.95,
  description: "...",
  canPurchase: true,
},
{
  name: "Pentagonal Gem",
  price: 5.95,
  description: "...",
  canPurchase: false,
}...
];

```

Maybe a Directive?

How might we display all these products in our template?

app.js

Working with An Array

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.products[0].name}} </h1>
    <h2> ${{store.products[0].price}} </h2>
    <p> {{store.products[0].description}} </p>
    <button ng-show="store.products[0].canPurchase">
      Add to Cart</button>
  </div>
  ...
</body>
```

index.html

Working with An Array

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.products[0].name}} </h1>
    <h2> ${{store.products[0].price}} </h2>
    <p> {{store.products[0].description}} </p>
    <button ng-show="store.products[0].canPurchase">
      Add to Cart</button>
  </div>
  ...
</body>
```

Displaying the first product
is easy enough...

index.html

Working with An Array

```
<body ng-controller="StoreController as store">
  <div>
    <h1> {{store.products[0].name}} </h1>
    <h2> ${{store.products[0].price}} </h2>
    <p> {{store.products[0].description}} </p>
    <button ng-show="store.products[0].canPurchase">
      Add to Cart</button>
  </div>
  <div>
    <h1> {{store.products[1].name}} </h1>
    <h2> ${{store.products[1].price}} </h2>
    <p> {{store.products[1].description}} </p>
    <button ng-show="store.products[1].canPurchase">
      Add to Cart</button>
  </div>
  ...
</body>
```

That works...

Dodecahedron
Some gems have hidden qualities beyond their luster, beyond their shine... Dodeca is one of those gems. \$2.95
Add to Cart

Pentagonal Gem
Origin of the Pentagonal Gem is unknown, hence its low value. It has a very high shine and 12 sides, \$5.95

Why... You get it.

index.html

Working with An Array

```
<body ng-controller="StoreController as store">
  <div ng-repeat="product in store.products">
    <h1> {{product.name}} </h1>
    <h2> ${{product.price}} </h2>
    <p> {{product.description}} </p>
    <button ng-show="product.canPurchase">
      Add to Cart</button>
  </div>
  ...
</body>
```

}

Repeat this
section for
each product.

index.html

The screenshot shows a web browser window titled "AngularJS" with the URL "run.plnkr.co/nsIRASW7RSFzW3EH/". The page displays two products:

- Dodecahedron**: Description: "Some gems have hidden qualities beyond their luster, beyond their shine... Dodeca is one of those gems." Price: **\$2.95**. Action: "Add to Cart" button.
- Pentagonal Gem**: Description: "Origin of the Pentagonal Gem is unknown, hence its low value. It has a very high shine and 12 sides, however." Price: **\$5.95**.

What We Have Learned So Far

D Directives – HTML annotations that trigger Javascript behaviors

M Modules – Where our application components live

C Controllers – Where we add application behavior

E Expressions – How values get displayed within the page

SHAPING UP
WITH
ANGULAR.JS

Shaping Up with Angular.JS

Level 2: Filters, Directives, and Cleaner Code

SHAPING UP
WITH
ANGULAR.JS

Directives We Know & Love

ng-app – attach the Application Module to the page

```
<html ng-app="store">
```

ng-controller – attach a Controller function to the page

```
<body ng-controller="StoreController as store">
```

ng-show / ng-hide – display a section based on an Expression

```
<h1 ng-show="name"> Hello, {{name}}! </h1>
```

ng-repeat – repeat a section for each item in an Array

```
<li ng-repeat="product in store.products"> {{product.name}} </li>
```

Our Current Code

```
<body ng-controller="StoreController as store">
  <ul class="list-group">
    <li class="list-group-item" ng-repeat="product in store.products">
      <h3>
        {{product.name}}
        <em class="pull-right">${{product.price}}</em>
      </h3>
    </li>
  </ul>
</body>
```

index.html

The screenshot shows a browser window with the title bar "AngularJS" and the address bar "angular.rocks/mysocks.com". The page content displays a list of products:

Product	Price
Dodecahedron	\$2
Pentagonal Gem	\$5.95

There's a better way
to print out prices.

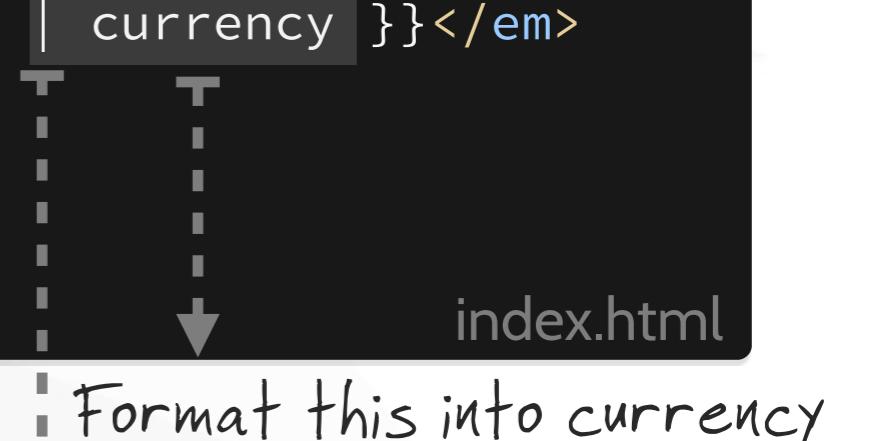

Our First Filter

```
<body ng-controller="StoreController as store">
  <ul class="list-group">
    <li class="list-group-item" ng-repeat="product in store.products">
      <h3>
        {{product.name}}
        <em class="pull-right">{{product.price | currency }}</em>
      </h3>
    </li>
  </ul>
</body>
```

Dodecahedron \$2.00

Pentagonal Gem \$5.95

Pipe - "send the output into"
Notice it gives the dollar sign (localized)
Specifies number of decimals

Formatting with Filters

Our Recipe `{{ data | filter:options* }}`

date

```
{{'1388123412323' | date:'MM/dd/yyyy @ h:mma'}}
```

12/27/2013 @ 12:50AM

uppercase & lowercase

```
{{'octagon gem' | uppercase}}
```

OCTAGON GEM

limitTo

```
{{'My Description' | limitTo:8}}
```

My Descr

```
<li ng-repeat="product in store.products | limitTo:3">
```

orderBy

Will list products by descending price.

```
<li ng-repeat="product in store.products | orderBy:'-price'">
```

Without the - products would list in ascending order.

Adding an Image Array to our Product Array

```
var gems = [
  { name: 'Dodecahedron Gem',
    price: 2.95,
    description: '...',
    images: [ ←-----+ Our New Array
      {←-----+ Image Object
        full: 'dodecahedron-01-full.jpg',
        thumb: 'dodecahedron-01-thumb.jpg'
      },
      {
        full: "dodecahedron-02-full.jpg",
        ...
      }
    ]
  }
]
```

app.js

To display the first image in a product:

```
{{product.images[0].full}}
```

Using ng-src for Images

Using Angular Expressions inside a **src** attribute causes an error!

```

```

...the browser tries to load the image
before the Expression evaluates.

```
<body ng-controller="StoreController as store">
  <ul class="list-group">
    <li class="list-group-item" ng-repeat="product in store.products">
      <h3>
        {{product.name}}
        <em class="pull-right">{{product.price | currency}}</em>
        
      </h3>
    </li>
  </ul>
</body>
```

NG-SOURCE
to the rescue!

index.html

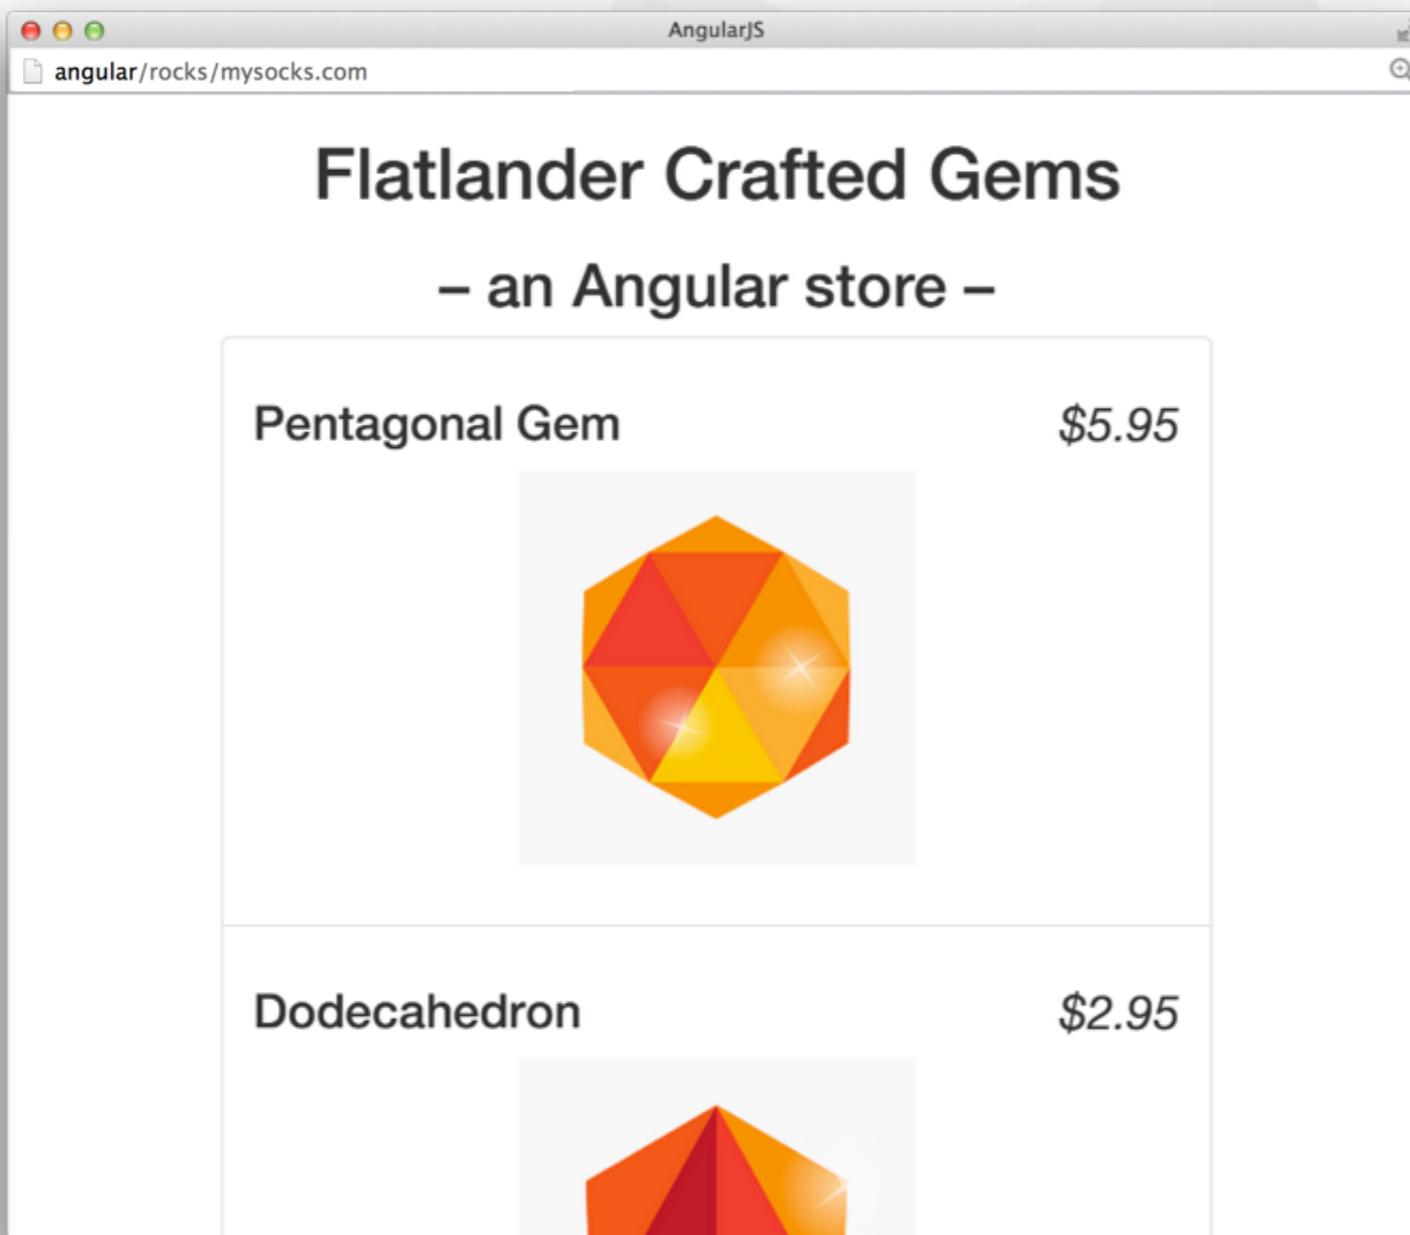

Our Products with Images

Screenshot of a web browser displaying a product catalog for "Flatlander Crafted Gems". The browser window has a title bar "AngularJS" and a URL bar showing "angular.rocks/mysocks.com".

The page title is "Flatlander Crafted Gems" followed by the subtitle "– an Angular store –".

Product	Price
Pentagonal Gem	\$5.95
Dodecahedron	\$2.95

Each product listing includes an image of the gemstone and its price.

Product	Price
Pentagonal Gem	\$5.95
Dodecahedron	\$2.95

Flatlander Crafted Gems
– an Angular store –

Dodecahedron

\$2.9

Description

Specifications

Reviews

Description

Some gems have hidden qualities beyond their luster,
beyond their shine... Dodeca is one of those gems.

How can I make my application
more interactive?

A Simple Set of Tabs

```
<section>
  <ul class="nav nav-pills">
    <li> <a href>Description</a> </li>
    <li> <a href>Specifications</a> </li>
    <li> <a href>Reviews</a> </li>
  </ul>
</section>
```

index.html

Description Specifications Reviews

Description

Some gems have hidden qualities beyond their luster,
beyond their shine... Dodeca is one of those gems.

SHAPING UP
WITH
ANGULAR.JS

Introducing a new Directive!

```
<section>
  <ul class="nav nav-pills">
    <li> <a href ng-click="tab = 1">Description</a> </li>
    <li> <a href ng-click="tab = 2">Specifications</a> </li>
    <li> <a href ng-click="tab = 3">Reviews</a> </li>
  </ul>
  {{tab}}
</section>
```

index.html

Assigning a value to tab.

For now just print this value to the screen.

SHAPING UP

ANGULAR.JS

angular.rocks/mysocks.com

Introducing a new Directive!

Flatlander Crafted Gems

– an Angular store –

Pentagonal Gem

\$5.95

[Description](#)

[Specifications](#)

[Reviews](#)

1

Dodecahedron

\$2.95

Whoa, it's dynamic and stuff...

When `ng-click` changes the value of `tab` ...

... the `{{tab}}` expression automatically gets updated!

Expressions define a 2-way Data Binding ...

this means Expressions are re-evaluated when a property changes.

Let's add the tab content panels

```
↑----- tabs are up here...
. . .
<div class="panel">
  <h4>Description</h4>
  <p>{{product.description}}</p>
</div>
<div class="panel">
  <h4>Specifications</h4>
  <blockquote>None yet</blockquote>
</div>
<div class="panel">
  <h4>Reviews</h4>
  <blockquote>None yet</blockquote>
</div>
```

How do we make the tabs trigger the panel to show?

Let's add the tab content panels

```
<div class="panel" ng-show="tab === 1">
  <h4>Description</h4>
  <p>{{product.description}}</p>
</div>
<div class="panel" ng-show="tab === 2">
  <h4>Specifications</h4>
  <blockquote>None yet</blockquote>
</div>
<div class="panel" ng-show="tab === 3">
  <h4>Reviews</h4>
  <blockquote>None yet</blockquote>
</div>
```

show the panel
if tab is the
right number

Now when a tab is selected it will show the appropriate panel!

Flatlander Crafted Gems

– an Angular store –

Pentagonal Gem

\$5.95

[Description](#)

[Specifications](#)

[Reviews](#)

Dodecahedron

\$2.95

But how do we set an initial value for a tab?

Setting the Initial Value

ng-init allows us to evaluate an expression in the current scope.

```
<section ng-init="tab = 1">
  <ul class="nav nav-pills">
    <li> <a href ng-click="tab = 1">Description</a> </li>
    <li> <a href ng-click="tab = 2">Specifications</a> </li>
    <li> <a href ng-click="tab = 3">Reviews</a> </li>
  </ul>
  . . .
```

index.html

Now with the Initial Tab

Flatlander Crafted Gems

– an Angular store –

Pentagonal Gem

\$5.95

[Description](#)

[Specifications](#)

[Reviews](#)

Description

Origin of the Pentagonal Gem is unknown, hence its low value. It has a very high shine and 12 sides,

Setting the Active Class

We need to set the `class` to `active` if current `tab` is selected ...

```
<section ng-init="tab = 1">
  <ul class="nav nav-pills">
    <li> <a href ng-click="tab = 1">Description</a> </li>
    <li> <a href ng-click="tab = 2">Specifications</a> </li>
    <li> <a href ng-click="tab = 3">Reviews</a></li>
  </ul>
```

index.html

SHAPING UP
WITH
ANGULAR.JS

The ng-class directive

```
<section ng-init="tab = 1">
  <ul class="nav nav-pills">
    <li ng-class="{ active:tab === 1 }">
      <a href ng-click="tab = 1">Description</a>
    </li>
    <li ng-class="{ active:tab === 2 }">
      <a href ng-click="tab = 2">Specifications</a>
    </li>
    <li ng-class="{ active:tab === 3 }">
      <a href ng-click="tab = 3">Reviews</a>
    </li>
  </ul>
  . . .

```

Name of the class to set.

Expression to evaluate
If true, set class to "active",
otherwise nothing.

Pentagonal Gem

\$5.95

Description

Specifications

Reviews

Description

Origin of the Pentagonal Gem is unknown, hence its low value. It has a very high shine and 12 sides,

Feels dirty, doesn't it?

All our application's logic is inside our HTML.

```
<section ng-init="tab = 1">
  <ul class="nav nav-pills">
    <li ng-class="{ active:tab === 1 }">
      <a href ng-click="tab = 1">Description</a>
    </li>
    <li ng-class="{ active:tab === 2 }">
      <a href ng-click="tab = 2">Specifications</a>
    </li>
    <li ng-class="{ active:tab === 3 }">
      <a href ng-click="tab = 3">Reviews</a>
    </li>
  </ul>
  <div class="panel" ng-show="tab === 1">
    <h4>Description </h4>
    <p>{{product.description}}</p>
  </div>
```

...

How might we pull this logic into a Controller?

index.html

Creating our Panel Controller

```
<section ng-init="tab = 1" ng-controller="PanelController as panel">
  <ul class="nav nav-pills">
    <li ng-class="{ active:tab === 1 }">
      <a href ng-click="tab = 1">Description</a>
    </li>
    <li ng-class="{ active:tab === 2 }">
      <a href ng-click="tab = 2">Specifications</a>
    </li>
    <li ng-class="{ active:tab === 3 }">
      <a href ng-click="tab = 3">Reviews</a>
    </li>
  </ul>
  <div class="panel" ng-show="tab === 1">
    <h4>Description </h4>
    <p>{{product.description}}</p>
  </div>
  ...

```

```
app.controller("PanelController", function(){
});
```

app.js

Moving our tab initializer

```
<section ng-controller="PanelController as panel">
  <ul class="nav nav-pills">
    <li ng-class="{ active:tab === 1 }">
      <a href ng-click="tab = 1">Description</a>
    </li>
    <li ng-class="{ active:tab === 2 }">
      <a href ng-click="tab = 2">Specifications</a>
    </li>
    <li ng-class="{ active:tab === 3 }">
      <a href ng-click="tab = 3">Reviews</a>
    </li>
  </ul>
  <div class="panel" ng-show="tab === 1">
    <h4>Description </h4>
    <p>{{product.description}}</p>
  </div>
...

```

```
app.controller("PanelController", function(){
  this.tab = 1;
});
app.js
```

Creating our selectTab function

```
<section ng-controller="PanelController as panel">
  <ul class="nav nav-pills">
    <li ng-class="{ active:tab === 1 }">
      <a href ng-click="panel.selectTab(1)">Description</a>
    </li>
    <li ng-class="{ active:tab === 2 }">
      <a href ng-click="panel.selectTab(2)">Specifications</a>
    </li>
    <li ng-class="{ active:tab === 3 }">
      <a href ng-click="panel.selectTab(3)">Reviews</a>
    </li>
  </ul>
  <div class="panel" ng-show="tab === 1">
    <h4>Description </h4>
    <p>{{product.description}}</p>
  </div>
  ...

```

```
app.controller("PanelController", function(){
  this.tab = 1;

  this.selectTab = function(setTab) {
    this.tab = setTab;
  });
});
```

app.js

Creating our isSelected function

```
<section ng-controller="PanelController as panel">
  <ul class="nav nav-pills">
    <li ng-class="{ active: panel.isSelected(1) }">
      <a href ng-click="panel.selectTab(1)">Description</a>
    </li>
    <li ng-class="{ active: panel.isSelected(2) }">
      <a href ng-click="panel.selectTab(2)">Specifications</a>
    </li>
    <li ng-class="{ active: panel.isSelected(3) }">
      <a href ng-click="panel.selectTab(3)">Reviews</a>
    </li>
  </ul>
  <div class="panel" ng-show="panel.isSelected(1)">
    <h4>Description </h4>
    <p>{{product.description}}</p>
  </div>
  ...

```

```
app.controller("PanelController", function(){
  this.tab = 1;

  this.selectTab = function(setTab) {
    this.tab = setTab;
  };
  this.isSelected = function(checkTab){
    return this.tab === checkTab;
  };
});
```

How can I let my users add content?

Adding reviews to our products

```
app.controller("StoreController", function(){
  this.products = [
    {
      name: 'Awesome Multi-touch Keyboard',
      price: 250.00,
      description: "...",
      images: [...],
      reviews: [
        {
          stars: 5,
          body: "I love this product!",
          author: "joe@thomas.com"
        },
        {
          stars: 1,
          body: "This product sucks",
          author: "tim@hater.com"
        }
      ...
    }
  ]
})
```

app.js

Looping Over Reviews in our Tab

```
<li class="list-group-item" ng-repeat="product in store.products">
  . . .
  <div class="panel" ng-show="panel.isSelected(3)">
    <h4> Reviews </h4>

    <blockquote ng-repeat="review in product.reviews">
      <b>Stars: {{review.stars}}</b>
      {{review.body}}
      <cite>by: {{review.author}}</cite>
    </blockquote>
  </div>
```

Nothing new here, but how do we start to implement forms?

Writing out our Review Form

```
<h4> Reviews </h4>

<blockquote ng-repeat="review in product.reviews">...</blockquote>

<form name="reviewForm">
  <select>
    <option value="1">1 star</option>
    <option value="2">2 stars</option>
    . . .
  </select>
  <textarea></textarea>
  <label>by:</label>
  <input type="email" />
  <input type="submit" value="Submit" />
</form>
```

Reviews
Submit a Review

Rate the Product

Write a short review of the product...

jimmyDean@sausage.com

Submit Review

index.html

With Live Preview

```
<form name="reviewForm">
  <blockquote>
    <b>Stars: {{review.stars}}</b>
    {{review.body}}
    <cite>by: {{review.author}}</cite>
  </blockquote>
  <select>
    <option value="1">1 star</option>
    <option value="2">2 stars</option>
    .
    .
    .
  </select>
  <textarea></textarea>
  <label>by:</label>
  <input type="email" />
  <input type="submit" value="Submit" />
</form>
```

How do we bind this review object to the form?

index.html

Introducing ng-model

```
<form name="reviewForm">
  <blockquote>
    <b>Stars: {{review.stars}}</b>
    {{review.body}}
    <cite>by: {{review.author}}</cite>
  </blockquote>
  <select ng-model="review.stars">
    <option value="1">1 star</option>
    <option value="2">2 stars</option>
    .
    .
    .
  </select>
  <textarea ng-model="review.body"></textarea>
  <label>by:</label>
  <input ng-model="review.author" type="email" />
  <input type="submit" value="Submit" />
</form>
```

ng-model binds the form element value to the property

index.html

Submit a Review

5

This gem is SO|

jimmyDean@sausage.com

Submit Review

But how do we actually add the new review?

Two More Binding Examples

With a Checkbox

```
<input ng-model="review.terms" type="checkbox" /> I agree to the terms
```

Sets value to true or false

With Radio Buttons

What color would you like?

```
<input ng-model="review.color" type="radio" value="red" /> Red  
<input ng-model="review.color" type="radio" value="blue" /> Blue  
<input ng-model="review.color" type="radio" value="green" /> Green
```

Sets the proper value based on which is selected

Challenges

SHAPING UP
WITH
ANGULAR.JS

We need to Initialize the Review

```
<form name="reviewForm">
  <blockquote>
    <b>Stars: {{review.stars}}</b>
    {{review.body}}
    <cite>by: {{review.author}}</cite>
  </blockquote>

  <select ng-model="review.stars">
    <option value="1">1 star</option>
    <option value="2">2 stars</option>
    . . .
  </select>
  <textarea ng-model="review.body"></textarea>
  <label>by:</label>
  <input ng-model="review.author" type="email" />
  <input type="submit" value="Submit" />
</form>
```

*We could do `ng-init`, but
we're better off
creating a controller.*

index.html

Creating the Review Controller

```
app.controller("ReviewController", function(){
  this.review = {};
});
```

app.js

```
<form name="reviewForm" ng-controller="ReviewController as reviewCtrl">
  <blockquote>
    <b>Stars: {{review.stars}}</b>
    {{review.body}}
    <cite>by: {{review.author}}</cite>
  </blockquote>

  <select ng-model="review.stars">
    <option value="1">1 star</option>
    <option value="2">2 stars</option>
    .
    .
  </select>
  <textarea ng-model="review.body"></textarea>
```

Now we need to update
all the Expressions to use
this controller alias.

index.html

Using the reviewCtrl.review

```
app.controller("ReviewController", function(){
  this.review = {};
});
```

app.js

```
<form name="reviewForm" ng-controller="ReviewController as reviewCtrl">
  <blockquote>
    <b>Stars: {{reviewCtrl.review.stars}}</b>
    {{reviewCtrl.review.body}}
    <cite>by: {{reviewCtrl.review.author}}</cite>
  </blockquote>

  <select ng-model="reviewCtrl.review.stars">
    <option value="1">1 star</option>
    <option value="2">2 stars</option>
    .
    .
  </select>
  <textarea ng-model="reviewCtrl.review.body"></textarea>
```

index.html

Using ng-submit to make the Form Work

```
app.controller("ReviewController", function(){
  this.review = {};
});
```

app.js

ng-submit allows us to call a function when the form is submitted.

```
<form name="reviewForm" ng-controller="ReviewController as reviewCtrl"
      ng-submit="reviewCtrl.addReview(product)">
  <blockquote>
    <b>Stars: {{reviewCtrl.review.stars}}</b>
    {{reviewCtrl.review.body}}
    <cite>by: {{reviewCtrl.review.author}}</cite>
  </blockquote>
```

We need to define
this function.

index.html

Using ng-submit to make the Form Work

```
app.controller("ReviewController", function(){
  this.review = {};

  this.addReview = function(product) {    Push review onto this
    product.reviews.push(this.review);
  };
});
```

product's reviews array.

app.js

```
<form name="reviewForm" ng-controller="ReviewController as reviewCtrl"
      ng-submit="reviewCtrl.addReview(product)"
      >
  <blockquote>
    <b>Stars: {{reviewCtrl.review.stars}}</b>
    {{reviewCtrl.review.body}}
    <cite>by: {{reviewCtrl.review.author}}</cite>
  </blockquote>
</form>
```

index.html

Now with Reviews!

Challenges

SHAPING UP
WITH
ANGULAR.JS

What about validations?

Turns out Angular has some great client side validations we can use with our directives.

SHAPING UP
WITH
ANGULAR.JS

Our Old Form Code

```
<form name="reviewForm" ng-controller="ReviewController as reviewCtrl"
      ng-submit="reviewCtrl.addReview(product)">
  <select ng-model="reviewCtrl.review.stars">
    <option value="1">1 star</option>
    ...
  </select>

  <textarea name="body" ng-model="reviewCtrl.review.body"></textarea>
  <label>by:</label>
  <input name="author" ng-model="reviewCtrl.review.author" type="email" />

  <input type="submit" value="Submit" />
</form>
```

index.html

Now with validation

Turn Off Default HTML Validation

```
<form name="reviewForm" ng-controller="ReviewController as reviewCtrl"
      ng-submit="reviewCtrl.addReview(product)" novalidate>
  <select ng-model="reviewCtrl.review.stars" required>
    <option value="1">1 star</option>
    ...
  </select>

  <textarea name="body" ng-model="reviewCtrl.review.body" required></textarea>
  <label>by:</label>
  <input name="author" ng-model="reviewCtrl.review.author" type="email" required/>

  <div> reviewForm is {{reviewForm.$valid}} </div> ← - · Print Forms Validity
  <input type="submit" value="Submit" />
</form>
```

Mark Required Fields

How might we give a hint to the user why their form is invalid?

The Input Classes

index.html

```
<input name="author" ng-model="reviewCtrl.review.author" type="email" required />
```

Source before typing email

```
<input name="author" . . . class="ng-pristine ng-invalid">
```

Source after typing, with invalid email

```
<input name="author". . . class="ng-dirty ng-invalid">
```

Source after typing, with valid email

```
<input name="author" . . . class="ng-dirty ng-valid">
```

So, let's highlight the form field using classes after we start typing, `ng-dirty` showing if a field is valid or invalid.

`ng-valid` `ng-invalid`

The classes

```
<input name="author" ng-model="reviewCtrl.review.author" type="email" required />  
index.html
```

```
.ng-invalid.ng-dirty {  
  border-color: #FA787E;  
}
```

Red border for invalid

```
.ng-valid.ng-dirty {  
  border-color: #78FA89;  
}
```

Green border for valid

style.css

HTML5-based type validations

Web forms usually have rules around valid input:

- Angular JS has built-in validations for common input types:

```
<input type="email" name="email">
```

```
<input type="url" name="homepage">
```

```
<input type="number" name="quantity">
```

Can also define min
& max with numbers

min=1 max=10

SHAPING UP
WITH
ANGULAR.JS

The background features a complex, abstract geometric pattern composed of numerous triangles in shades of red, orange, yellow, and magenta, set against a dark purple background.

SHAPING UP
WITH
ANGULAR.JS

Shaping Up with Angular JS

Level 4: Creating a Directive with an
Associated Controller

SHAPING UP
WITH
ANGULAR.JS

Decluttering our Code

```
<ul class="list-group">
  <li class="list-group-item" ng-repeat="product in store.products">
    <h3>
      {{product.name}}
      <em class="pull-right">${{product.price}}</em>
    </h3>
    <section ng-controller="PanelController as panel">
      . . .

```

index.html

We're going to have multiple pages that want to reuse this HTML snippet.

How do we eliminate this duplication?

SHAPING UP
WITH
ANGULAR.JS

Using ng-include for Templates

```
<ul class="list-group">
  <li class="list-group-item" ng-repeat="product in store.products">
    <h3 ng-include="'product-title.html'"> ↗ → name of file to include
    </h3>
    <section ng-controller="PanelController as panel">           index.html
```

ng-include is expecting a variable with the name of the file to include.
To pass the name directly as a string, use single quotes (' . . . ')

```
  {{product.name}}
  <em class="pull-right">${{product.price}}</em>
```

↓
product-title.html

```
<h3 ng-include="'product-title.html'" class="ng-scope">
  <span class="ng-scope ng-binding">Awesome Multi-touch Keyboard</span>
  <em class="pull-right ng-scope ng-binding">$250.00</em>
</h3>
```

generated html

Web Server

Web Browser

HTML JavaScript

Browser loads up
Angular app.

HTML

Creating our First Custom Directive

Using ng-include...

```
<h3 ng-include="'product-title.html'"></h3>
```

index.html

Custom Directive

```
<product-title></product-title>
```

index.html

Our old code and our custom Directive will do the same thing...
with some additional code.

Why write a Directive?

SHAPING UP
WITH
ANGULAR.JS

Why Directives?

Directives allow you to write HTML that expresses the behavior of your application.

```
<aside class="col-sm-3">
  <book-cover></book-cover>
  <h4><book-rating></book-rating></h4>
</aside>

<div class="col-sm-9">
  <h3><book-title></book-title></h3>

  <book-authors></book-authors>

  <book-review-text></book-review-text>

  <book-genres></book-genres>
</div>
```

Can you tell what
this does?

SHAPING UP
WITH
ANGULAR.JS

Writing Custom Directives

Template-expanding Directives are the simplest:

- define a custom tag or attribute that is expanded or replaced
- can include Controller logic, if needed

Directives can also be used for:

- Expressing complex UI
- Calling events and registering event handlers
- Reusing common components

How to Build Custom Directives

```
<product-title></product-title>
```

index.html

```
app.directive('productTitle', function(){
  return {
    // A configuration object defining how your directive will work
  };
});
```

app.js

How to Build Custom Directives

```
<product-title></product-title>
```

index.html

dash in HTML translates to ... camelCase in JavaScript

```
app.directive('productTitle', function(){
  return {
    restrict: 'E', Type of Directive  
(E for Element)
    templateUrl: 'product-title.html' Url of a template
  };
});
```

generates
into
app.js

```
<h3>
  {{product.name}}
  <em class="pull-right">$250.00</em>
</h3>
```

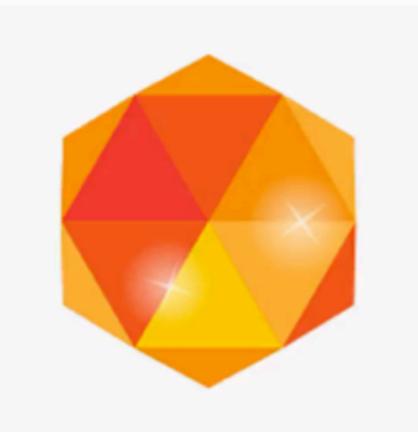

index.html

Flatlander Crafted Gems

– an Angular store –

Pentagonal Gem

\$5.95

Description

Specifications

Reviews

Description

Origin of the Pentagonal Gem is unknown, hence its low value. It has a very high shine and 12 sides,

Attribute vs Element Directives

Element Directive

```
<product-title></product-title>
```

index.html

Notice we're not using a self-closing tag...

```
<product-title/>
```

...some browsers don't like self-closing tags.

Attribute Directive

```
<h3 product-title></h3>
```

index.html

Use Element Directives for UI widgets and Attribute Directives for mixin behaviors... like a tooltip.

SHAPING UP
WITH
ANGULAR.JS

Defining an Attribute Directive

```
<h3 product-title></h3>
```

index.html

```
app.directive('productTitle', function(){
  return {
    restrict: 'A', Type of Directive  
(A for Attribute)
    templateUrl: 'product-title.html'
  };
});
```

generates
into
app.js

```
<h3>
  {{product.name}}
  <em class="pull-right">$250.00</em>
</h3>
```

index.html

Though normally attributes would be for mixin behaviors ...

Directives allow you to write better HTML

When you think of a dynamic web application, do you think you'll be able to understand the functionality just by looking at the HTML?

No, right?

When you're writing an Angular JS application, you should be able to understand the behavior and intent from just the HTML.

And you're likely using custom directives to write expressive HTML.

SHAPING UP
WITH
ANGULAR.JS

Shaping Up with Angular JS

Creating Our Own Directives

SHAPING UP
WITH
ANGULAR.JS

Reviewing our Directive

Template-Expanding Directives

```
<h3>
  {{product.name}}
  <em class="pull-right">${{product.price}}</em>
</h3>
```

index.html

An Attribute Directive

```
<h3 product-title></h3>
```

An Element Directive

```
<h3> <product-title></product-title> </h3>
```

What if we *need* a Controller?

```
<section ng-controller="PanelController as panels">
  <ul class="nav nav-pills"> . . . </ul>
  <div class="panel" ng-show="panels.isSelected(1)"> . . . </div>
  <div class="panel" ng-show="panels.isSelected(2)"> . . . </div>
  <div class="panel" ng-show="panels.isSelected(3)"> . . . </div>
</section>
```

index.html

Directive?

SHAPING UP
WITH
ANGULAR.JS

First, extract the template...

```
<h3> <product-title> </h3>
<product-panels ng-controller="PanelController as panels">
  . . .
</product-panels>
```

index.html

```
<section>
<ul class="nav nav-pills"> . . . </ul>
<div class="panel" ng-show="panels.isSelected(1)"> . . . </div>
<div class="panel" ng-show="panels.isSelected(2)"> . . . </div>
<div class="panel" ng-show="panels.isSelected(3)"> . . . </div>
</section>
```

product-panels.html

SHAPING UP
WITH
ANGULAR.JS

Now write the Directive ...

```
<product-panels ng-controller="PanelController as panels">  
  . . .  
</product-panels>
```

index.html

```
app.directive('productPanels', function(){  
  return {  
    restrict: 'E',  
    templateUrl: 'product-panels.html'  
  };  
});
```

app.js

What about the Controller?

```
<product-panels ng-controller="PanelController as panels">  
  . . .  
</product-panels>
```

index.html

```
app.directive('productPanels', function(){  
  return {  
    restrict: 'E',  
    templateUrl: 'product-panels.html'  
  };  
});  
app.controller('PanelController', function(){  
  . . .  
});
```

app.js

First we need to move the functionality inside the directive

Moving the Controller Inside

```
<product-panels ng-controller="PanelController as panels" >  
  . . .  
</product-panels>
```

index.html

Next, move the alias inside

```
app.directive('productPanels', function(){  
  return {  
    restrict: 'E',  
    templateUrl: 'product-panels.html',  
    controller: function(){  
      . . .  
    }  
  };  
});
```

app.js

Need to Specify the Alias

```
<product-panels>
  ...
</product-panels>
```

index.html

```
app.directive('productPanels', function(){
  return {
    restrict: 'E',
    templateUrl: 'product-panels.html',
    controller: function(){
      ...
    },
    controllerAs: 'panels'
  };
});
```

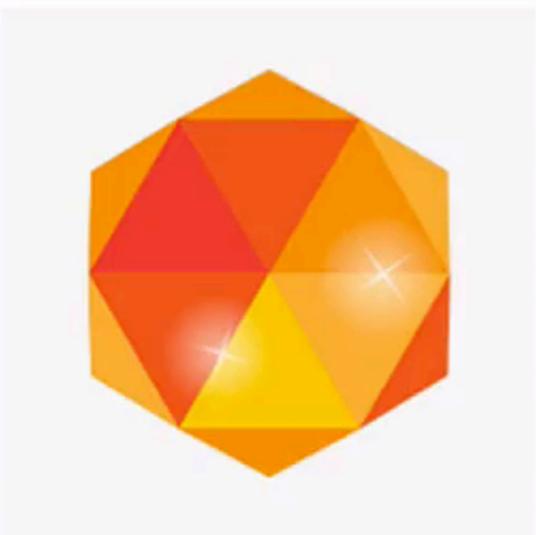

Now it works, using `panels` as our Controller Alias.

app.js

Shaping Up with Angular JS

Level 5: Dependencies and Services

SHAPING UP
WITH
ANGULAR.JS

Starting to get a bit cluttered?

```
(function(){
  var app = angular.module('store', []);

  app.controller('StoreController', function(){ . . . });

  app.directive('productTitle', function(){ . . . });
  app.directive('productGallery', function(){ . . . });
  app.directive('productPanels', function(){ . . . });
  .
  .
  .
})();
```

*Can we refactor
these out?*

app.js

SHAPING UP
WITH
ANGULAR.JS

Extract into a new file ... products.js

```
(function(){
  var app = angular.module('store', []);
  app.controller('StoreController', function(){ . . . });
  . . .
})();
```

app.js

```
app.directive('productTitle', function(){ . . . });
app.directive('productGallery', function(){ . . . });
app.directive('productPanels', function(){ . . . });
```

products.js

Make a new Module

```
(function(){
  var app = angular.module('store', []);
  app.controller('StoreController', function(){ . . . });
  . . .
})();
```

Define a new module just
for Product stuff...

Module Name
app.js

Different closure
means different
app variable.

```
(function(){
  var app = angular.module('store-products', []);
  app.directive('productTitle', function(){ . . . });
  app.directive('productGallery', function(){ . . . });
  app.directive('productPanels', function(){ . . . });
})();
```

products.js

Add it to the dependencies ...

store depends on
store-products

```
(function(){
  var app = angular.module('store', ['store-products']);

  app.controller('StoreController', function(){ . . . });
  . . .
})();
```

Module Name

app.js

```
(function(){
  var app = angular.module('store-products', [ ]);

  app.directive('productTitle', function(){ . . . });

  app.directive('productGallery', function(){ . . . });

  app.directive('productPanels', function(){ . . . });
})();
```

products.js

We'll also need to include the file

```
<!DOCTYPE html>
<html ng-app="store">
  <head> . . . </head>
  <body ng-controller="StoreController as store">
    . . .
    <script src="angular.js"></script>
    <script src="app.js"></script>
    <script src="products.js"></script>
  </body>
</html>
```

How should I organize my application Modules?

Best to split Modules around functionality:

- `app.js` - top-level module attached via `ng-app`
- `products.js` - all the functionality for products and only products

Challenges

SHAPING UP
WITH
ANGULAR.JS

Does this feel strange?

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', function(){
    this.products = [
      { name: '...', price: 1.99, ... },
      { name: '...', price: 1.99, ... },
      { name: '...', price: 1.99, ... },
      ...
    ];
    ...
  });
})();
```

What is all this data
doing here?

app.js

Where can we put it?
Shouldn't we fetch this from an API?

SHAPING UP
WITH
ANGULAR.JS

How do we get that data?

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', function(){
    this.products = ???; ←----- How do we fetch our
    . . .
  });
})();
```

app.js

<http://api.example.com/products.json>

[

```
{ name: '...', price: 1.99, . . . },
{ name: '...', price: 1.99, . . . },
{ name: '...', price: 1.99, . . . },
. . .
```

]

We need a Service!

Services give your Controller additional functionality, like ...

- Fetching JSON data from a web service with `$http`
- Logging messages to the JavaScript console with `$log`
- Filtering an array with `$filter`

All built-in Services
start with a \$
sign ...

Introducing the \$http Service!

The \$http Service is how we make an async request to a server ...

- By using \$http as a function with an options object:

```
$http({ method: 'GET', url: '/products.json' });
```

- Or using one of the shortcut methods:

```
$http.get('/products.json', { apiKey: 'myApiKey' });
```

- Both return a Promise object with .success() and .error()
- If we tell \$http to fetch JSON, the result will be automatically decoded into JavaScript objects and arrays

So how do we use it?

SHAPING UP
WITH
ANGULAR.JS

How does a Controller use a Service like \$http?

Use this funky array syntax:

```
app.controller('SomeController', [ '$http', function($http){  
} ]);
```

Service name

Service name as an argument

Dependency Injection!

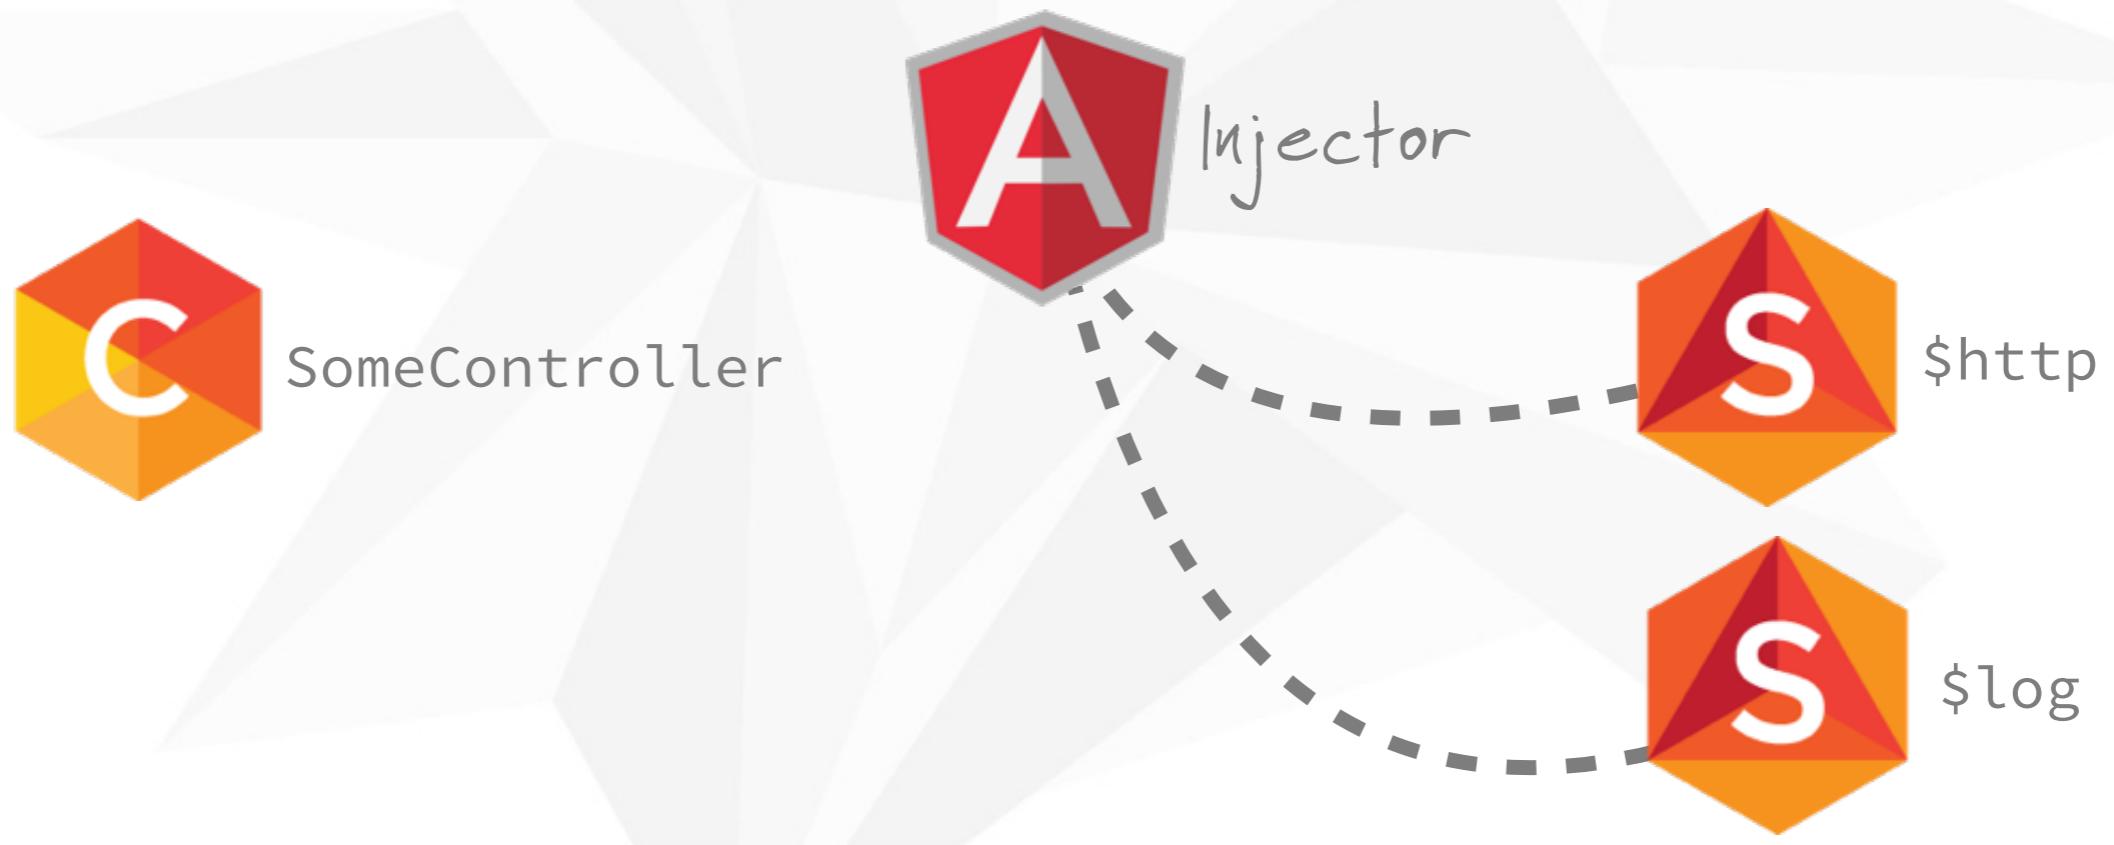

```
app.controller('SomeController', [ '$http', '$log', function($http, $log){  
} ]);
```

If you needed more than one

When Angular is Loaded Services are Registered

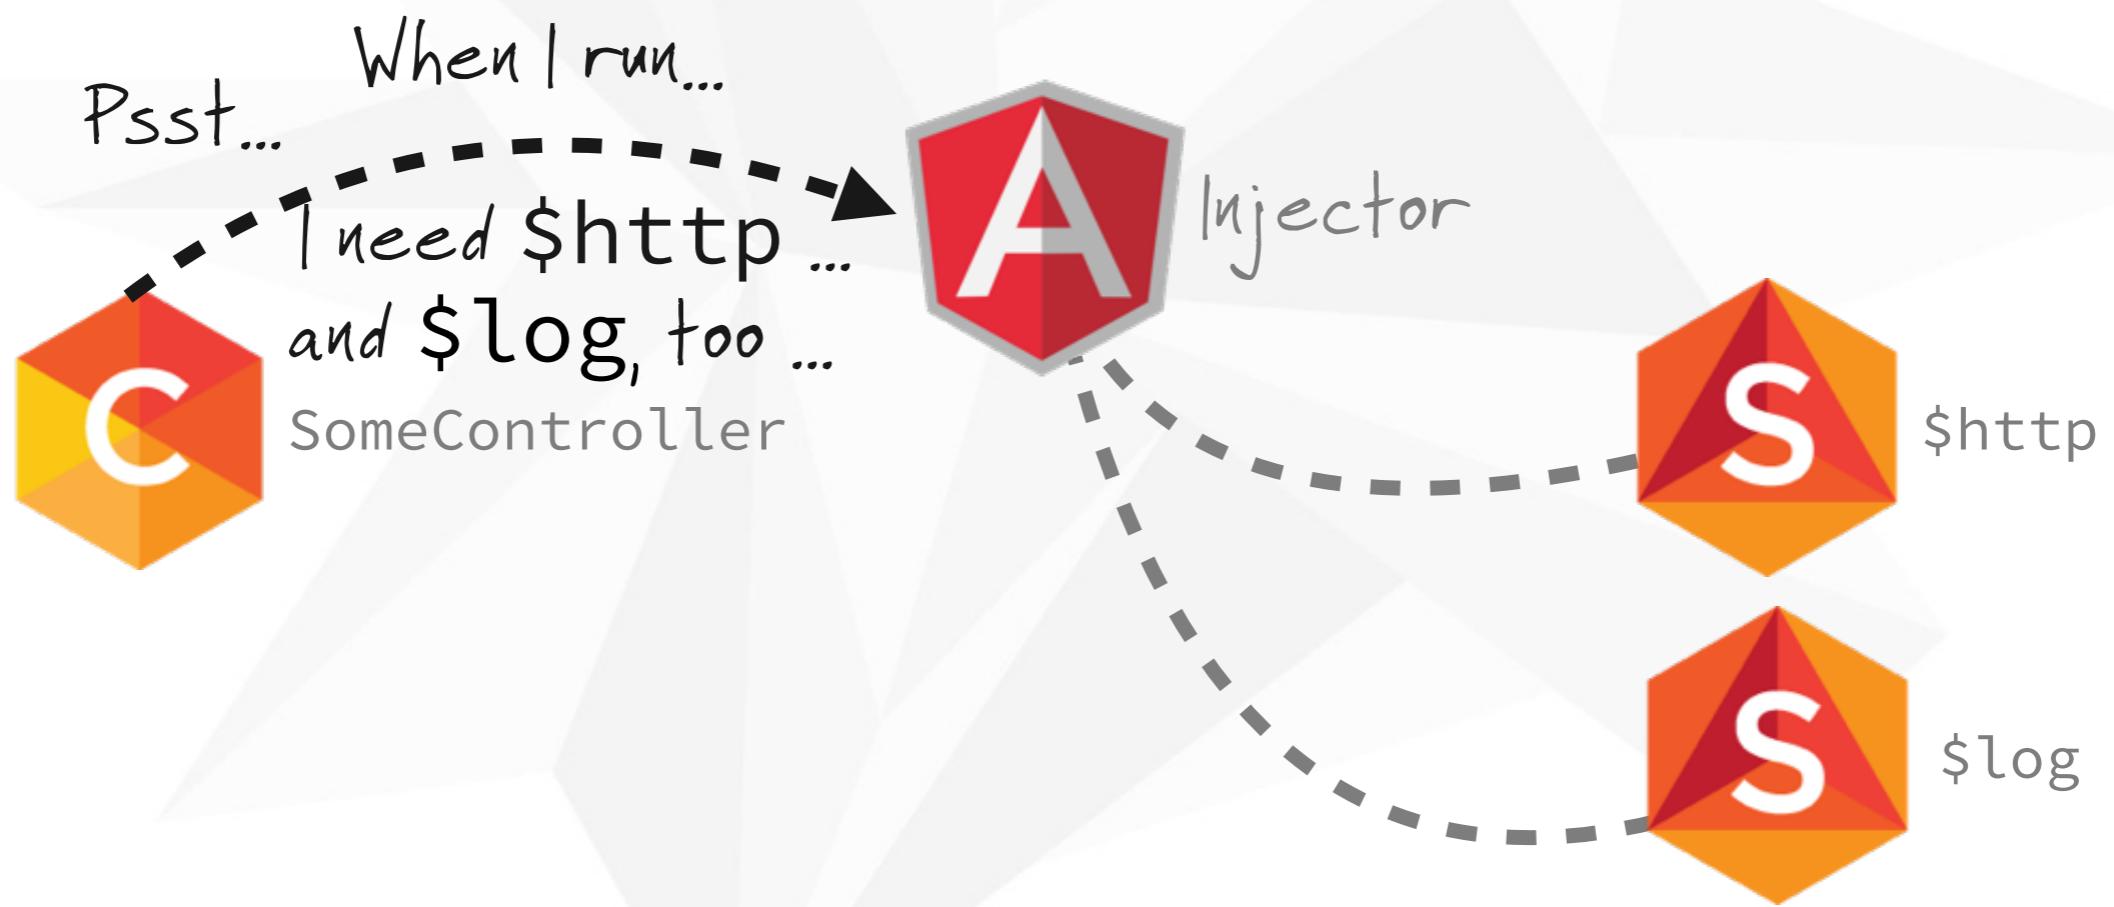

```
app.controller('SomeController', [ '$http', '$log', function($http, $log){  
} ]);
```

A Controller is Initialized

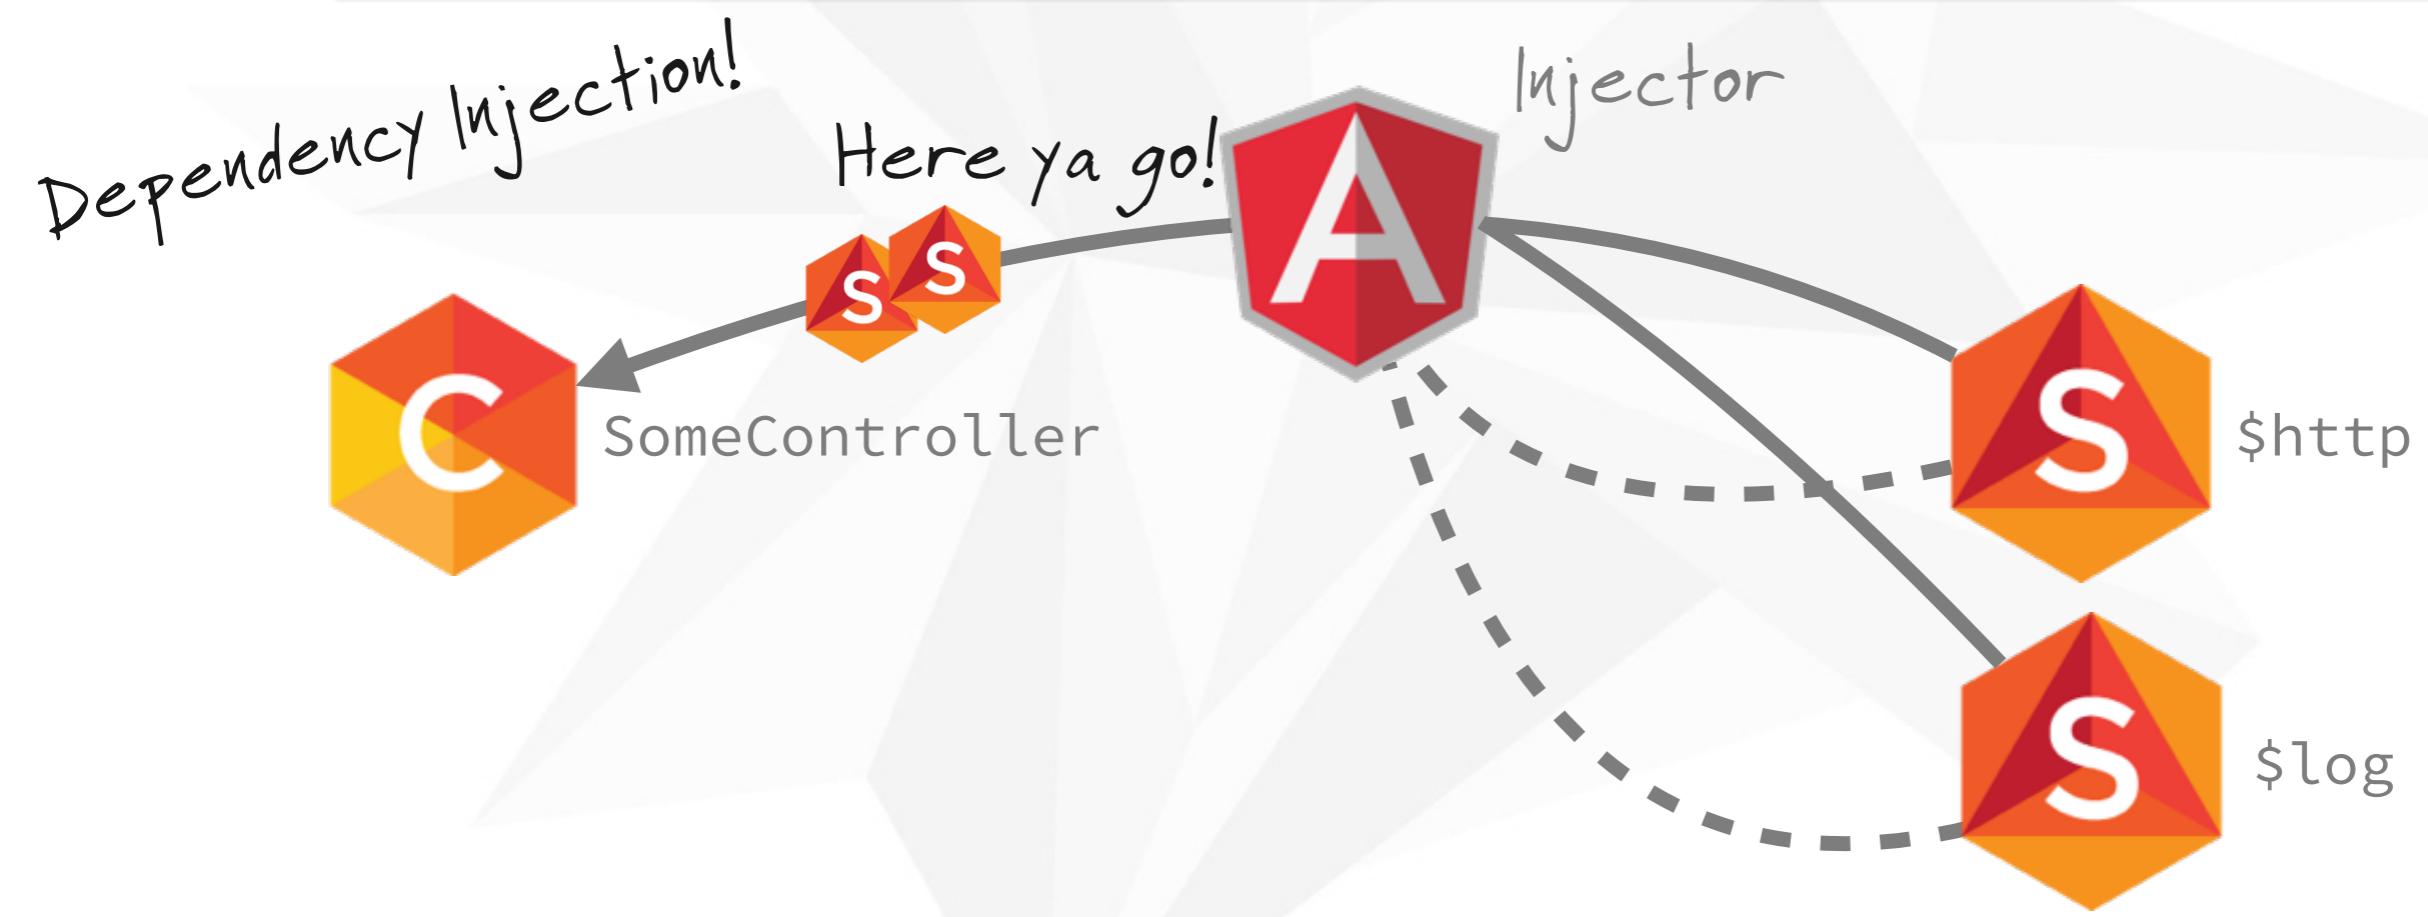

```
app.controller('SomeController', [ '$http', '$log', function($http, $log){  
} ]);
```

Then When the Controller runs ...

```
app.controller('SomeController', [ '$http', '$log', function($http, $log){  
} ]);
```

So where were we?

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', function(){
    this.products = ???;
  });
})();
```

app.js

SHAPING UP
WITH
ANGULAR.JS

Time for your injection!

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', [ '$http',function($http){
    this.products = ???;
  }]);
})();
```

StoreController needs
the \$http Service...

...so \$http
gets injected
as an argument!

app.js

Now what?

SHAPING UP
WITH
ANGULAR.JS

Let's use our Service!

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', [ '$http',function($http){
    this.products = ???;

    $http.get('/products.json')
  }]);
})();
```

Fetch the contents of
products.json...

app.js

SHAPING UP
WITH
ANGULAR.JS

Our Service will Return Data

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', [ '$http',function($http){
    this.products = ???;

    $http.get('/products.json').success(function(data){
      ??? = data;
    });
  }]);
})();
```

What do we assign
data to, though...?

\$http returns a Promise, so
success() gets the data...

app.js

Storing the Data for use in our Page

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', [ '$http',function($http){
    var store = this;

    $http.get('/products.json').success(function(data){
      store.products = data;
    });
  }]);
})();
```

... and now we have somewhere
to put our data!

But the page might look funny until the data loads.

SHAPING UP
WITH
ANGULAR.JS

Initialize Products to be a Blank Array

```
(function(){
  var app = angular.module('store', [ 'store-products' ]);

  app.controller('StoreController', [ '$http',function($http){
    var store = this;
    store.products = [ ];  
    ←-----  
    $http.get('/products.json').success(function(data){
      store.products = data;  We need to initialize products to an empty
    });  
  }]);  
})();
```

app.js

Flatlander Crafted Gems

– an Angular store –

Gem #1: Zircon

\$1,100.00

Description

Specs

Reviews

Description

Zircon is a mineral composed of zirconium silicate.

Additional \$http functionality

In addition to get() requests, \$http can post(), put(), delete()...

```
$http.post('/path/to/resource.json', { param: 'value' });
```

```
$http.delete('/path/to/resource.json');
```

...or any other HTTP method by using a config object:

```
$http({ method: 'OPTIONS', url: '/path/to/resource.json' });
```

```
$http({ method: 'PATCH', url: '/path/to/resource.json' });
```

```
$http({ method: 'TRACE', url: '/path/to/resource.json' });
```
